

A Buoy Array for Ocean Wave Power Generation

September 28, 2010
University of Central Florida
College of Engineering and Computer Science

Principle Investigators

- Dr. Zhihua Qu
 - Professor / Interim Chair – Electrical and Computer Engineering Division
- Dr. Kuo-Chi Lin
 - Professor – Dept. of Mechanical and Aerospace Engineering

Researchers

- Shiyuan Jin
 - Ph.D. student – Computer Engineering
- Carlos Velez
 - Master's student – Aerospace Engineering
- Steven Helkin
 - Master's student – Mechanical Engineering
- Karan Kutty
 - Master's student – Electrical Engineering

Sponsors

- Florida Energy Systems Consortium
 - \$150,000 two-year project, completed
- Harris Corporation
 - \$10,000 one-year continuation project

Wave Energy

- Very few designs in use today
- Water has ~1000 times greater power density as air
- A 1-meter wave: 9.5 kW of power (per meter of shoreline)

Renewable energy, end of 2008 (GW)

Total vs. Renewable

* GWth

** Billion liters/year

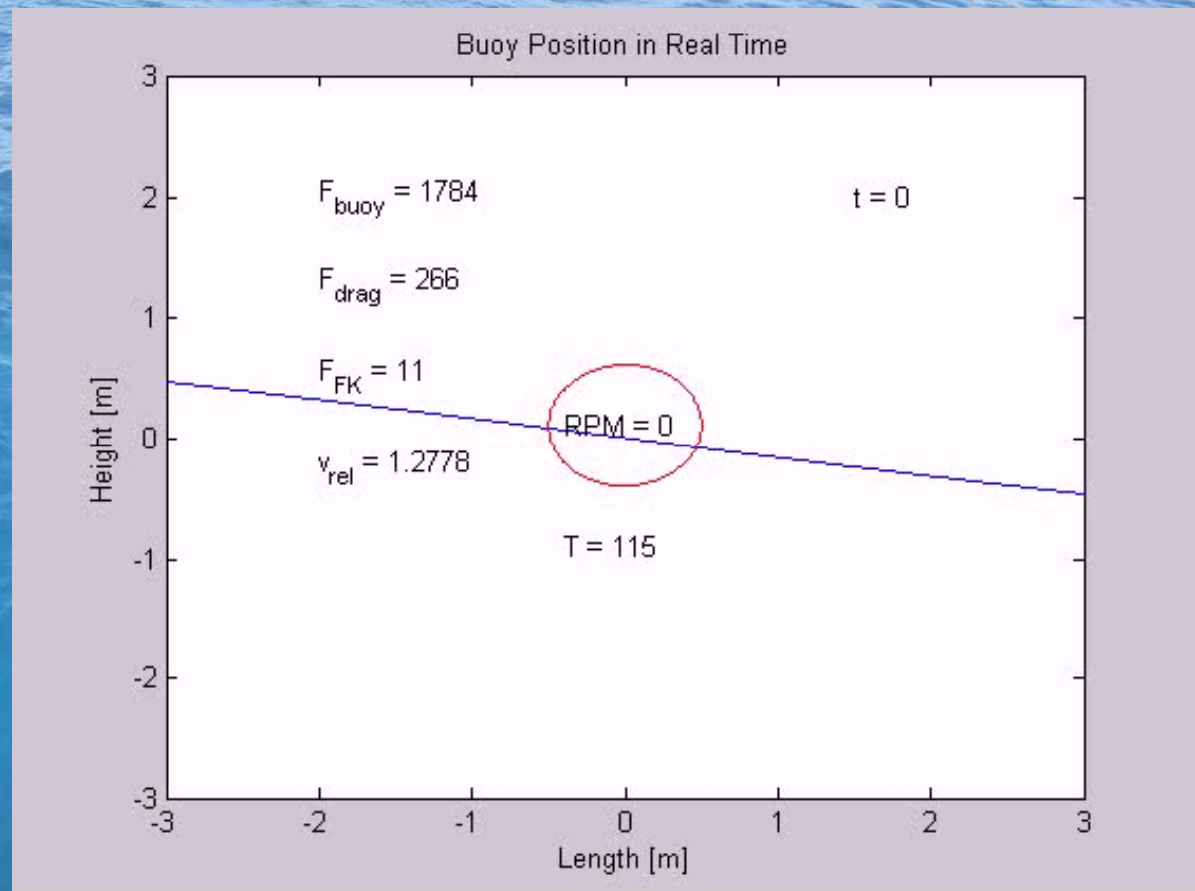

Conceptual Design

- Wave point absorber
- Rotary generator
- Flywheel energy storage

Modeling & Simulation

- Calculates
 - Shaft RPM
 - Power
 - Cable Tension
- Adjustable inputs allows for system optimization

Hydrodynamic Analysis

- Buoyancy force, and resulting motion
- Effect of buoy size and weight on buoy's response to waves.
- Data was used to help validate the hydrodynamic simulation

First Generation Prototype

- Proof of concept
- Average Power: 37 Watts

Second Generation Prototype

- Larger flywheel & improved generator
- 4:1 RPM
- Avg. Power: 206 Watts

Experimental Platform

- Hydraudyne 6 DoF Platform
- Sinusoidal input
 - Amplitude: 10.0 cm
 - Frequency: 0.30 Hz

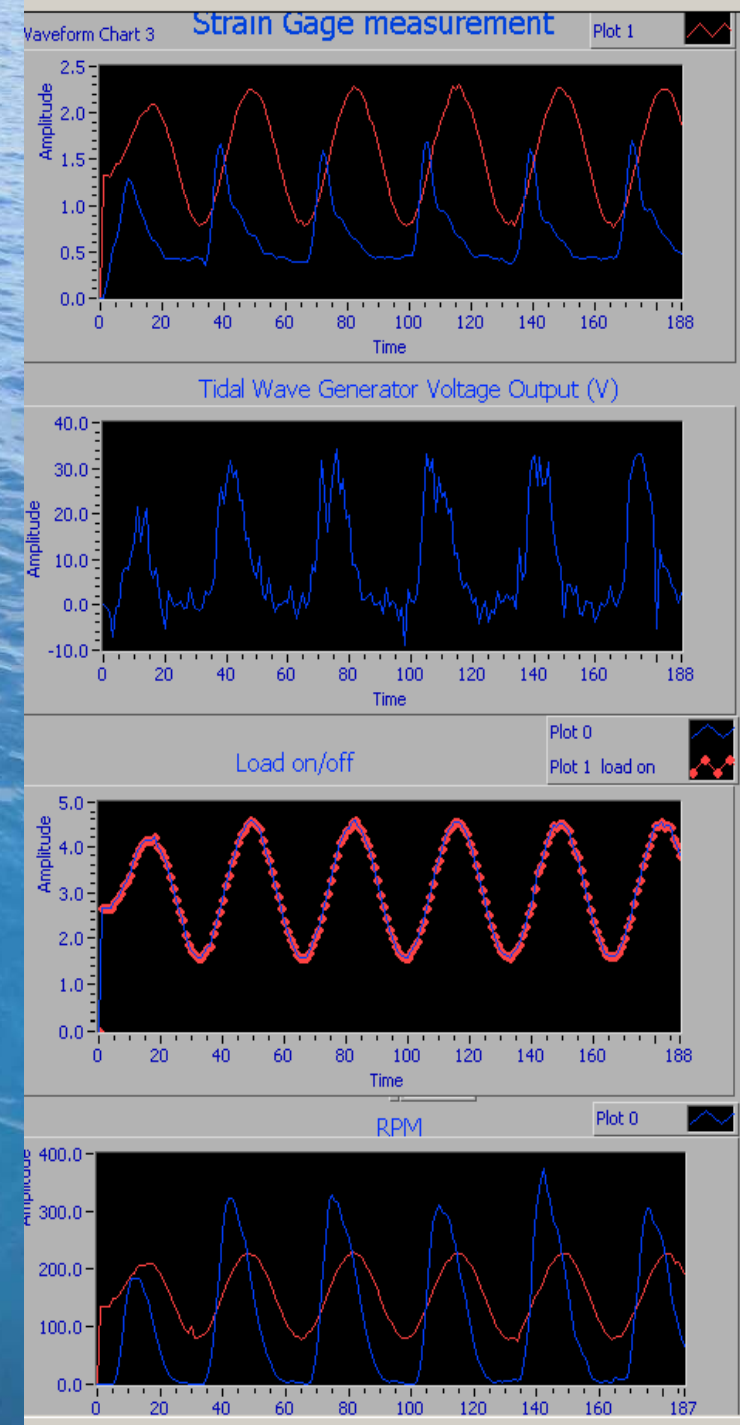

Data Acquisition

- Shaft RPM
 - Rotational energy
 - Theoretical efficiency
 - Shaft stresses - acceleration & shaft inertia
- Voltage Generated
 - Power produced
 - Actual system efficiency
- Tension in the Wire
 - Shaft torque
 - Force input

Optimization

- Generator load
 - Always on
- Effect
 - Rotation not conserved
 - High power output
 - High tension

Optimization

- Generator load
 - Dynamic control
- Effect
 - Continuous rotation
 - Higher Power output
 - Lower Tension

Tidal Wave Generator Voltage Output (V)

Load on/off

Design Drawbacks

- Difficult to protect against corrosion
- Only takes advantage of upward motion
- Requires spring to keep tension in cable

Future Project Overview

- Ocean waves heave floating buoy
- Relative fluid motion develops torque
- Torque results in power

Bi-directional Turbine

- Impulse turbine
- Symmetry results in uni-directional torque

Applications

- Wave farm array to provide power to grid
- Power for offshore platforms
- Power for sensor buoy

Conclusion

- Research findings from initial prototypes have lead to a more evolved design
- Collaboration with Harris Corp. will result in an ocean-ready prototype by April 2011

Acknowledgments

- Florida Energy Systems Consortium
- Harris Corporation
- University of Central Florida
