1. **Agency Name**

Air Force Office of Scientific Research  
Arlington VA

2. **Funding Opportunity Title**

Research Interests of the Air Force Office of Scientific Research

3. **Announcement Type**

This is the initial announcement.

4. **Funding Opportunity Number**

BAA-AFOSR-2011-01

5. **Catalog of Federal Domestic Assistance (CFDA) Numbers**

12.800

6. **Due Dates**

This announcement remains open until superseded. Proposals are reviewed and evaluated as they are received. Proposals may be submitted at any time.

7. **Additional Overview**

The Air Force Office of Scientific Research (AFOSR) manages the basic research investment for the U.S. Air Force (USAF). As a part of the Air Force Research Laboratory (AFRL), AFOSR’s technical experts foster and fund research within the Air Force Research Laboratory, universities, and industry laboratories to ensure the transition of research results to support USAF needs. Using a carefully balanced research portfolio, research managers seek to create revolutionary scientific breakthroughs, enabling the Air Force and U.S. industry to produce world-class, militarily significant, and commercially valuable products.

To accomplish this task, AFOSR solicits proposals for basic research through this general Broad Agency Announcement (BAA). This BAA outlines the Air Force Defense Research Sciences Program. AFOSR invites proposals for research in many broad areas. These areas are described in detail in Section I, Funding Opportunity Description.
AFOSR is seeking unclassified, white papers and proposals that do not contain proprietary information. We expect our research to be fundamental.

It is anticipated the awards will be made in the form of a grant, cooperative agreement or contract. AFOSR reserves the right to select and fund for award; all, some, part or none of the proposals in response to this announcement.

This announcement will remain open until replaced by a successor BAA. Proposals may be submitted at any time. However, those planning to submit proposals should consider that AFOSR commits the bulk of its funds in the Fall of each year.

AFOSR will not issue paper copies of this announcement. AFOSR provides no funding for direct reimbursement of proposal development costs. Technical and cost proposals, or any other material, submitted in response to this BAA will not be returned.
# TABLE OF CONTENTS

I. FUNDING OPPORTUNITY DESCRIPTION .............................................6

I. Funding Opportunity Description

AFOSR plans, coordinates, and executes the Air Force Research Laboratory’s (AFRL) basic research program in response to technical guidance from AFRL and requirements of the Air Force; fosters, supports, and conducts research within Air Force, university, and industry laboratories; and ensures transition of research results to support USAF needs.

The focus of AFOSR is on research areas that offer significant and comprehensive benefits to our national warfighting and peacekeeping capabilities. These areas are organized and managed in three scientific directorates: Aerospace, Chemical and Material Sciences, Physics and Electronics, and Mathematics, Information and Life Sciences. The research activities managed within each directorate are summarized in this section.

Aerospace, Chemical and Material Sciences (RSA)

The Aerospace, Chemical and Material Sciences Directorate leads the discovery and development of the fundamental and integrated science that advances future air and space power. The broad goal of the directorate is to discover and exploit the critical fundamental science and knowledge that will shape the future of aerospace sciences. A key emphasis is the establishment of the foundations necessary to advance the integration or convergence of the scientific disciplines critical to maintaining technological superiority. The Directorate carries out its ambitious mission through leadership of an international, highly diverse and multidisciplinary research community to find, support and foster new scientific discoveries that will ensure future novel innovations for the future Air Force.

The central research direction for this directorate focuses on meeting the basic research challenges related to future air and space power by leading the discovery and development of fundamental science and engineering across three integrated research focus areas:

Aero-Structure Interaction and Control: Focus on the characterization, modeling and exploitation of interactions between the unsteady aerodynamic flow field, the complex surface chemistry and dynamic air vehicle structure to enable unprecedented performance.

Complex Materials and Structures: Focus on complex materials, Microsystems and structures by incorporating hierarchical design and functionality from the nanoscale through the mesoscale, ultimately leading to controlled well understood material or structural behavior capable of dynamic functionality and/or performance characteristics to enhance mission versatility.

Energy, Power and Propulsion: Focus on the production, storage, and utilization of energy and harnessing the power of phonons for Air Force systems including the development of novel energetic materials for new propulsion and munitions concepts.
A wide range of fundamental research addressing chemistry, materials, fluid dynamics, thermophysics and structural mechanics are brought together to address these multidisciplinary topics in an effort to increase performance and achieve unprecedented operational capability.

1) Mechanics of Multifunctional Materials and Microsystems, Dr. Les Lee
2) Multi-Scale Structural Mechanics and Prognosis, Dr. David Stargel
3) Thermal Sciences, Dr. Kumar Jata
4) Organic Materials Chemistry, Dr. Charles Lee
5) Theoretical Chemistry and Molecular Dynamics, Dr. Michael Berman
6) Aerospace Materials for Extreme Environments, Dr. Ali Sayir
7) Low Density Materials, Dr. Joycelyn Harrison
8) Aerothermodynamics and Turbulence, Dr. John Schmisseur
9) Flow Interactions and Control, Dr. Douglas Smith
10) Space Power and Propulsion, Dr. Mitat Birkan

Research areas are described in detail in the Sub areas below.

1. Mechanics of Multifunctional Materials & Microsystems

The main goals of this program are to establish safer, more maneuverable aerospace vehicles and platforms with unprecedented performance characteristics; and to bridge the gap between the viewpoints from materials science on one side and structural engineering on the other in forming a science base for the materials development and integration criteria. Specifically, the program seeks to establish the fundamental understanding required to design and manufacture new aerospace materials and microsystems for multifunctional structures and to predict their performance and integrity based on mechanics principles. The multifunctionality implies coupling between structural performance and other as-needed functionalities (such as electrical, magnetic, optical, thermal, chemical, biological, and so forth) to deliver dramatic improvements in system-level efficiency. Structural performance includes the ability to carry the load, durability, reliability, survivability and maintainability in response to the changes in surrounding environments or operating conditions. Among various visionary contexts for developing multifunctionalities, the concepts of particular interest are: (a) “autonomic” structures which sense, diagnose and respond for adjustment with minimum external intervention, (b) “adaptive” structures allowing reconfiguration or readjustment of functionality, shape and mechanical properties on demand, and (c) structural integration of energy harvesting/storage capabilities for “self-sustaining” system. This program thus focuses on the developing new design criteria involving mechanics, physics, chemistry, biology, and information science to model and characterize the integration and performance of multifunctional materials and microsystems at multiple scales from atoms to continuum. Projected Air Force applications require material systems and devices which often consist of dissimilar constituents with different functionalities. Interaction with Air Force Research Laboratory researchers is encouraged to maintain relevance and enhance technology transition.

Dr. Les Lee AFOSR/RSA (703) 696-8483
2. Multi-Scale Structural Mechanics and Prognosis

This fundamental basic research program addresses the US Air Force needs in the following application areas: 1) New and revolutionary flight structures, 2) Multi-scale modeling and prognosis and 3) Structural dynamics under non-stationary conditions and extreme environments. Other game-changing and revolutionary structural mechanics problems relevant to the US Air Force are also of interest.

The structural mechanics program encourages fundamental basic research that will generate understanding, models, analytical tools, numerical codes, and predictive methodologies validated by carefully conducted experiments. The program seeks to establish the fundamental understanding required to design and manufacture new aerospace materials and structures and to predict their performance and integrity based on mechanics principles.

Fundamental basic research issues for new and revolutionary flight structures include: revolutionary structural concepts and unprecedented flight configurations; hybrid structures of dissimilar materials (metallic, composite, ceramic, etc.) with multi-material joints and/or interfaces under dynamic loads, and extreme environments; controlled-flexibility distributed-actuation smart structures. The predictive analysis and durability prognosis of hybrid-material structures that synergistically combine the best attributes of metals, composites, and ceramics, while avoiding their inherit shortcomings is of great interest.

Fundamental basic research issues of interest for multi-scale modeling and prognosis include: physics-based models that quantitatively predict the materials performance and durability of metallic and composite flight structures operating at various regimes; modeling and prediction of the structural flaws distribution and service-induced damage on each aircraft and at fleet level; structural analysis that accounts for variability due to materials, processing, fabrication, maintenance actions, changing mission profiles; novel and revolutionary on-board health monitoring and embedded NDE concepts. An area of particular research interest is the development and validation of new diagnostic techniques capable of measurements at the mesoscale. Experimental techniques capable of simultaneous measurements on multiple length scales (i.e. meso to macro) are also sought.

Fundamental basic research issues for structural dynamics include: control of dynamic response of extremely flexible nonlinear structures; control of unsteady energy flow in nonlinear structures during various flight conditions; nonlinear dynamics and vibration control of thin-wall structures of functionally graded hybrid materials with internal vascular networks under extreme loading conditions.

Researchers are highly encouraged to submit short white papers prior to developing full proposals. White papers are encouraged as an initial and valuable step prior to proposal development and submission. White papers should briefly relate the current state-of-the-art,
how the proposed effort would advance it, and the approximate yearly cost for a three to five year effort. Researchers with white papers of significant interest will be invited to submit full proposals.

Dr. David Stargel AFOSR/RSA (703) 696-6961  
DSN 426-6961 FAX (703) 696-7320  
E-mail: david.stargel@afosr.af.mil

3. Thermal Sciences

As demands continue to be placed on an increasingly smaller size scale of structural and electronic components, or a higher density of components with multi functionality is placed onto smaller volumes, and with the increased processing speeds of electronic components and the heat encountered by structures, there is a heavy penalty that arises from thermal loads and heat flux. Components are facing extreme heat blockage that renders them to failure and the heat needs to be extracted, or they need to be cooled for improved performance and reliability.

Although there is a good scientific understanding of heat transfer at the macroscale, there remains a lack of sound scientific understanding, and a lack of scientific principles to tackle heat transfer at the micro and nano scale at the materials level for next-generation aerospace systems. Furthermore, there is a need to validate or extend the thermal science principles developed for materials to device- and component levels. The connecting “scale-up science” is lacking. There are also major gaps in basic science that require intense research in experimentation and interpretation of the results. A need for novel experiments to understand the phenomenon of heat transfer at very small spatial and temporal scales exists.

Proposals addressing fundamental science continue to be sought in the areas of phonon transport, contribution of phonon dispersion modes to thermal transport, understanding of extreme thermal conductivity, thermal conductivity in hybrid materials, nanoscale modification of surfaces carrying the hot liquids with and without external stimuli, and thermal rectification and thermal diodes. Proposals addressing new ideas and directions related to understanding of thermal transport, thermal memory, and phonon-assisted devices are highly encouraged. As new energy concepts are being introduced, an understanding of the role of thermal transport for thermal energy storage, rate limiting steps of thermal transport in materials, and thermal energy conversion is becoming crucial to understand. Beyond the conduction in solids, basic scientific research in the area of small- and large scale heat removal through convection mechanisms, augmented by external stimuli and exploitation of phase change approaches, are needed. An understanding of radiative properties and their contribution to energy storage and conversion are also of much interest to this portfolio. Proposals addressing theory and experiments are highly encouraged.

Researchers are highly encouraged to submit short white papers prior to developing full proposals. White papers are encouraged as an initial and valuable step prior to proposal development and submission. White papers should briefly relate the current state-of-the-art, how the proposed effort would advance it, and the approximate yearly cost for a three to five
year effort. Researchers with white papers of significant interest will be invited to submit full proposals.

Dr. Kumar Jata AFOSR/RSA
DSN (703) 696-7361 FAX (703) 696-7320
Email: kumar.jata@afosr.af.mil

4. Organic Materials Chemistry

The goal of this research area is to gain a better understanding of the influence of chemical structures and processing conditions on the properties and behaviors of polymeric and organic materials. This understanding will lead to development of advanced organic and polymeric materials for Air Force applications. This program’s approach is to study the chemistry and physics of these materials through synthesis, processing, characterization and establishing the structure properties relationship of these materials. This area addresses both functional properties and properties pertinent to structural applications. Materials with these properties will provide capabilities for future Air Force systems to achieving global awareness, global mobility, and space operations. Research concepts that are novel, high risk with potential high payoff are encouraged.

Proposals with innovative material concepts that will extend our understanding of the structure-property relationship of these materials and achieve significant property improvement over current state-of-the-art materials are sought. Current interests include photonic polymers and liquid crystals, polymers with interesting electronic properties, polymers with controlled dielectric permittivity and magnetic permeability including negative index materials, and novel properties polymers modified with nanostructures. Applications of polymers in extreme environments, including Space operation environments, are of interests. Material concepts for power management applications, power generation and storage are of interest.

In the area of photonic polymers, research emphases are on materials whose refractive index can be actively controlled. These include, but are not limited to, electrooptic polymers, liquid crystals, photorefractive polymers and magneto-optical polymers. Organic molecules with large nonlinear real and imaginary components are also of interest. Examples of electronic properties of interest include conductivity, charge mobility, electro-pumped lasing and solar energy harvesting. Material concepts related to power generation and storage will be considered. Controlled growth and/or self assembly of nanostructures into well defined structures (e.g. carbon nanotubes with specific chirality) or hierarchical and complex structures are encouraged. Organic based materials, including inorganic hybrids, with controlled magnetic permeability and dielectric permittivity are also of interest. Material concepts that will provide low thermal conductivity but high electrical conductivity (as thermoelectric), or vice versa, (as thermally conductive electrical insulator) are of interests.

Nanotechnology approaches are encouraged to address all the above-mentioned issues. Approaches based on biological systems or other novel approaches to attain material properties that are difficult to achieve through conventional means are encouraged.
5. Theoretical Chemistry and Molecular Dynamics

Theoretical Chemistry
The major objective of the theoretical chemistry program is to develop new methods that can be utilized as predictive tools for designing new materials and improving processes important to the Air Force. These new methods can be applied to areas of interest to the Air Force including the structure and stability of molecular systems that can be used as advanced propellants; molecular reaction dynamics; and the structure and properties of nanostructures and interfaces. We seek new theoretical and computational tools to identify novel energetic molecules, investigate the interactions that control or limit the stability of these systems, and help identify the most promising synthetic reaction pathways and predict the effects of condensed media on synthesis. Particular interests in reaction dynamics include developing methods to seamlessly link electronic structure calculations with reaction dynamics, understanding the mechanism of catalytic processes and proton-coupled electron transfer related to storage and utilization of energy, and using theory to describe and predict the details of ion-molecule reactions and electron-ion dissociative recombination processes relevant to ionospheric and space effects on Air Force systems. Interest in nanostructures and materials includes work on catalysis and surface-enhanced processes mediated by plasmon resonances. This program also encourages the development of new methods to simulate and predict properties with chemical accuracy for systems having a very large number of atoms that span multiple time and length scales.

Molecular Dynamics
The objectives of the molecular dynamics program are to understand, predict, and control the reactivity and flow of energy in molecules. This program seeks experimental and joint theory-experiment studies that address key, fundamental questions in these areas that can lead to important advances in these fields. A major area of interest includes understanding processes related to the efficient storage and utilization of energy. For example, we seek to understand the fundamental reaction mechanisms of catalysis in these systems. Thus, we have interest in studying the structure, dynamics, and reactivity of molecular clusters and nanoscale systems in which the number of atoms or specific arrangement of atoms in a cluster has dramatic effects on its reactivity or properties. The ability to promote and probe these reactions and processes using surface-enhanced methods mediated by plasmon resonances is of interest, as are other novel sensitive diagnostic methods for detecting individual molecules and probing nanostructures and processes on nanostructures. Utilizing catalysts to produce storable fuels from sustainable inputs and to improve propulsion processes are topics of interest. Fundamental studies aimed at developing basic understanding and predictive capabilities for chemical reactivity, bonding, and energy transfer processes are also encouraged.

Work in this program also addresses areas in which control of chemical reactivity and energy flow at a detailed molecular level is of importance. These areas include hyperthermal and ion-
chemistry in the upper atmosphere and space environment, the identification of novel energetic materials for propulsion systems, and the discovery of new high-energy laser systems. The coupling of chemistry and fluid dynamics in high speed reactive flows, and in particular, dynamics at gas-surface interfaces, is also of interest.

6. Aerospace Materials for Extreme Environments

The objective of basic research in Aerospace Materials for Extreme Environments is to provide the fundamental knowledge required to enable revolutionary advances in future Air Force technologies through the discovery and characterization of high temperature materials (nominally temperatures above 1000°C) including: ceramics, metals, hybrid systems including composites. Specifically, the program seeks innovative and high risk proposals that advance the field of high temperature materials research through the discovery and characterization of new materials that exhibit superior structural, functional and/or multifunctional performance at temperatures above 1000 °C. Representative scientific topics include the development and experimental verification of theoretical and/or computational tools that aid in the discovery of new materials and in situ characterization methods for probing microstructural evolution at elevated temperatures. There is special interest in fundamental research of high temperature structural materials focused on understanding combined mechanical behaviors; e.g. strength and toughness as a function of thermal and acoustic loads and understanding the damage initiation. This focus area provide broad scientific challenges and will require the development of new experimental and computational tools to address the complexity of thermal, acoustic, chemistry, shear or pressure loads as they relate back to the performance of the material. Another representative topic includes physics and chemistry of materials in highly stressed environments where system performance depends on, and limited by, the evolution and/or degradation of materials in the presence of high electrical, thermal, radiative, or other stresses. This area includes a wide range of activities characterized by processes that are sufficiently energetic to require the understanding and managing the non-linear response of materials to combined loads under high energy density non-equilibrium extremities.

This program seeks bold, new basic research that addresses the design, creation, and employment of nontraditional approaches on synthesis of novel materials and nanostructures, for example, by using electric fields, lasers, microwave and other external field approaches that take into account of geometric or topological descriptors to characterize similarity and scaling between stimuli under the multi-dimensional external fields to secure revolutionary advances. Interest domain includes the fundamental science at the interface of phases of heterogeneous structures, nanotechnology and mesotechnology efforts are focused on new architectures using crystal chemistry principles to create pathways to synthesize transparent ceramics, fiber materials, actuator materials, three dimensional power structures and heterogeneous materials for high energy density applications. This program also embraces materials that are far from the thermodynamic equilibrium domain (bulk metallic glasses, highly doped polycrystalline
materials and supersaturated structures etc..). Realization of these multi-component systems that are far from equilibrium may also require new approaches to how computation itself is modeled or even an entirely new understanding of computation. Often the modeling approaches make casual inference about the microstructural features and basic research methodologies and metrics are needed. The aim is to explore the possibility for the quantification of microstructure through reliable and accurate descriptions of grain and particle shapes, and identifying sample distributions of shape descriptors to generate and predict structures which might revolutionize the design and performance. It is important to consider integrated experimental approaches that concurrently validates the length and time scales and thus may require cross-disciplinary teams with material scientist and engineers in collaboration with mathematicians, statisticians, computer scientists and physicist, and chemist, etc., are encouraged, especially when collaboration is likely to generate multidimensional benefits. Researchers with ideas relating to performance of materials in device, material integration in system level, and structural performance should refer to the other programs in this Broad Area Announcement to find the best match for those research ideas.

Researchers are highly encouraged to submit short (max 2 pages) white papers by email prior to developing full proposals. White papers should briefly describe the proposed effort and describe how it will advance the current state-of-the-art; an approximate yearly cost for a three to five year effort should also be included. Researchers with white papers of significant interest will be invited to submit full proposals. Multidisciplinary team proposals also are encouraged and will be considered on a case by case basis.

Dr. Ali Sayir, AFOSR/RSA (703) 696-7236
DSN 426-7236 FAX (703) 696-7320
E-Mail: ali.sayir@afosr.af.mil

7. Low Density Materials

The Low Density Materials portfolio supports transformative, basic research in materials design and processing to enable radical reductions in system weight with concurrent enhancements in performance and function. Such materials can transform the design of future Air Force aerospace and cyber systems for applications which include airframes, satellites, and adaptive vehicles. Among the routes to achieving game-changing improvements in low density materials currently emphasized within the program are understanding the impact of nanoscale porosity on aerospace structures and the creation of hierarchical architectures that combine materials of different classes, scales, and properties to provide synergistic and tailorable performance. Proposals are sought that advance our understanding of hierarchical or hybrid materials and our ability to design, model and fabricate multi-material, multi-scale, multi-functional material systems with a high degree of precision and efficiency. Fundamental research targeting radical improvements in stimuli-responsive materials that can be used to couple structure and function in aerospace platforms is also a keen program interest. Material classes may be polymeric, ceramic, and metallic, possibly combining synthetic and biological species to engender lightweight structural integrity and multifunctionality.
Researchers are highly encouraged to submit short (max 2 pages) white papers by email prior to developing full proposals. White papers should briefly describe the proposed effort, the fundamental challenges to be addressed, and how the proposed research will advance the current state-of-the-art; an approximate yearly cost for a three to five year effort should also be included. Researchers with white papers of significant interest will be invited to submit full proposals.

Dr. Joycelyn Harrison, AFOSR/RSA (703) 696-6225
DSN 426-6225 FAX (703) 696-7320
E-Mail: joycelyn.harrison@afosr.af.mil

8. Aerothermodynamics and Turbulence

The objective of the aerothermodynamics and turbulence portfolio is to develop the fundamental fluid physics knowledge base required for revolutionary advancements in Air Force capabilities including, but not limited to, Efficient Long-Range Access, Rapid Global Strike and Responsive Space Access. Research supported by this portfolio seeks to characterize, model and exploit/control critical fluid dynamic phenomena through a balanced mixture of investments in experimental, numerical and theoretical efforts.

Innovative research is sought in all aspects of turbulent and aerothermodynamic flows with particular interest in the following areas:

- Characterization and modeling of the coupled dynamics, thermodynamics and chemistry of nonequilibrium flows, including fundamental processes in high-temperature gas-surface interactions.
- Innovative insight into the control and exploitation of energy transfer within the flowfield is of particular interest. (Note: Combustion processes are addressed by other portfolios and are not within the scope of interest.)
- Shock/Boundary Layer and Shock-Shock Interactions
- Laminar-turbulent stability, transition and turbulence in high-Mach number boundary layers, especially approaches leading to greater insight into surface heat transfer.
- Characterization and modeling of the impact of realistic surface conditions on transitional and turbulent flows in all speed regimes.
- Innovative experiments and numerical simulations that identify the underlying sources and potential control mechanisms for noise radiated from high-speed hot jets.

The behavior of the boundary layer impacts the aerodynamic performance of systems across all speed regimes of interest to the Air Force. The development of accurate methods for predicting the behavior of transitional and turbulent boundary layers across a wide range of flow conditions will facilitate the design of future systems with optimized performance and fuel-economy. Aerothermodynamic research is critical to the Air Force’s interest in long-range and space operations. The size and weight of a high-speed vehicle, and thus its flight trajectory and required propulsion system, are largely determined by aerothermodynamic considerations. Research areas of interest emphasize the characterization, prediction and control of high-speed
fluid dynamic phenomena including boundary layer transition, shock/boundary layer, and shock/shock interactions, and other phenomena associated with airframe-propulsion integration. High-temperature gas kinetics, aerothermodynamics and interactions between the hypersonic flow and thermal protection system materials are of particular interest.

Researchers are highly encouraged to submit short (max 6 pages) white papers prior to developing full proposals. White papers are a valuable initial exercise prior to proposal development and submission. White papers should briefly describe the proposed effort and illustrate how it will advance the current state-of-the-art; an approximate yearly cost for a three year effort should also be included. Researchers with white papers of significant interest will be invited to submit full proposals.

Dr. John Schmisseur AFOSR/RSA (703) 696-6962
DSN 426-6962 FAX (703) 696-7320
E-mail: john.schmisseur@afosr.af.mil

9. Flow Interactions and Control

The Flow Interactions and Control portfolio is interested in basic research problems associated with the motion and control of laminar, transitional and turbulent shear flows, including the interactions of these flows with rigid and flexible surfaces. The portfolio seeks to advance fundamental understanding of complex, time-dependent flow interactions by integrating theoretical/analytical, numerical, and experimental approaches. The focus on the understanding of the fundamental flow physics is motivated by an interest in developing physically-based predictive models and innovative control concepts for these flows.

The portfolio is interested in aerodynamic interactions arising in both internal and external flows and extending over a wide range of Reynolds numbers. Research in this portfolio is motivated by, but not limited to, applications including unique fluid-structure interactions including those found in the human body, vortex and shear layer flows, and micro-air vehicle flows.

The portfolio emphasizes the characterization, modeling/prediction, and control of flow instabilities, turbulent fluid motions, and fluid-structure interactions for both bounded and free-shear flows with application to aero-optics, surfaces in actuated motion, flexible and compliant aerodynamic surfaces, vortical flows, and flows with novel geometric configurations. The portfolio maintains an interest in the flow physics of the dynamic interaction between unsteady aerodynamics, nonlinear structural deformations, and aerodynamic control effectors over a wide range of flight regimes. Although the portfolio has a strong emphasis in flow control, studies examining underlying flow physics with a path to enabling control of the flow will also be considered. Studies integrating modeling, control theory, and advanced sensor and/or actuator technology for application to a flow of interest are encouraged. Flow control studies are expected to involve a feedback approach based on a fundamental insight into the flow physics.

Prospective researchers are strongly encouraged to submit short (max 6 pages) white papers to the program manager prior to developing full proposals. White papers are viewed as a valuable
first step in the proposal development and submission process. White papers should briefly describe the proposed effort, illustrate how it will advance the current state-of-the-art, and address the relevance to Air Force interests. Note, however, that basic research of the variety typically funded by the portfolio may not yet have a clear transition map to an application. The integration of theoretical, numerical, and experimental tools to improve understanding is encouraged. An approximate yearly cost for a three year effort should also be included. Researchers with white papers of significant interest will be invited to submit full proposals.

Dr. Douglas Smith AFOSR/RSA (703) 696-6219
DSN 426-6219 FAX (703) 696-7320
E-mail: douglas.smith@afosr.af.mil

10. Space Power and Propulsion

Research activities fall into three areas: non-chemical launch and in-space propulsion, chemical propulsion, and plume contamination resulting from both chemical and non-chemical propulsion. Research in the first area is directed primarily at advanced space propulsion, and is stimulated by the need to transfer payloads between orbits, station-keeping, and pointing, including macro- and nano-satellite propulsion. It includes studies of the sources of physical (non-chemical) energy and the mechanisms of release. Emphasis is on understanding electrically conductive flowing propellants (plasmas or charged particles) that serve to convert beamed or electrical energy into kinetic form.

Theoretical and experimental investigations focus on the phenomenon of energy coupling and the transfer of plasma flows in electrode and electrodeless systems under dynamic environments. Studies to enable revolutionary designs of satellite systems that can achieve the simultaneous objectives of increasing payload and/or time in orbit and increasing mission flexibility and scope are of interest.

Research sought on methods to predict and suppress combustion instabilities, including propellant additives, and develop research models that can be incorporated into the design codes.

Areas of research interest may include, but are not limited to: (1) design and testing of compact, highly efficient and robust chemical or electric propulsion systems with minimal power conditioning requirements; (2) demonstration of innovative uses of power and/or propulsion systems for sensing, communication, or other applications; (3) thermal management, sensing, self-healing, and other fundamental concepts to increase efficiency, and lifetime of space structures; (4) innovative processes that transform structural material into high energy density propellant (e.g. phase change, or even biological process); (5) novel energetic materials; and (6) development of modeling and simulation capabilities at all relevant scales.

Dr. Mitat A. Birkan AFOSR/RSA (703) 696-7234

E-mail: mitat.birkan@afosr.af.mil
**Physics and Electronics (RSE)**

Research in physics and electronics generates the fundamental knowledge needed to advance Air Force operational capabilities. Research directions are categorized in three broad areas:

**Complex Electronics and Fundamental Quantum Processes:** This includes exploration and understanding of a wide range of complex engineered materials and devices, including non-linear optical materials, optoelectronics, metamaterials, cathodes, dielectric and magnetic materials, high energy lasers, semiconductor lasers, new classes of high temperature superconductors, quantum dots, quantum wells, and graphene. Research into new classes of devices based on quantum phenomena can include new generations of ultra compact or ultrasensitive electronics to improve conventional devices for sensing or information processing and such new concepts as quantum computing. This area also includes generating and controlling quantum states, such as superposition and entanglement, in photons and ultra cold atoms and molecules (e.g. Bose Einstein Condensates). In addition to research into underlying materials and fundamental physical processes, this area considers how they might be integrated into new classes of devices, seeking breakthroughs in quantum information processing, secure communication, multi-modal sensing, and memory, as well as high speed communication and fundamental understanding of materials that are not amenable to conventional computational means (e.g., using optical lattices to model high-temperature superconductors).

**Plasma Physics and High Energy Density Nonequilibrium Processes:** This area includes a wide range of activities characterized by processes that are sufficiently energetic to require the understanding and managing of plasma phenomenology and the non-linear response of materials to high electric and magnetic fields. This includes such endeavors as space weather, plasma control of boundary layers in turbulent flow, plasma discharges, RF propagation and RF-plasma interaction, and high power beam-driven microwave devices. It also includes topics where plasma phenomenology is not necessarily central to the activity but is nonetheless an important aspect, such as laser-matter interaction (including high energy as well as ultra short pulse lasers) and pulsed power. This area pursues advances in the understanding of fundamental plasma and non-linear electromagnetic phenomenology, including modeling and simulations, as well a wide range of novel potential applications involving matter at high energy density.

**Optics, Electromagnetics, Communication, and Signal Processing:** This area considers all aspects of producing and receiving complex electromagnetic and electro optical signals, as well as their propagation through complex media, including adaptive optics and optical imaging. It also covers aspects of the phenomenology of lasers and non-linear optics. This area not only considers the advancement of physical devices to enable such activities, but also includes sophisticated mathematics and algorithm development for extracting information from complex and/or sparse signals. This cross-cutting activity impacts such diverse efforts as space object imaging, secure reliable
communication, on-demand sensing modalities, distributed multilayered sensing, automatic target recognition, and navigation.

The physics and electronics program includes theoretical and experimental physics from all disciplines, as well as engineering issues such as those found in microwave or photonic systems or materials-processing techniques. One main objective of the program is to balance innovative science and Air Force relevance, the first element being forward looking and the second being dependent on the current state-of-the-art. Research areas of interest to the Air Force program managers are described in detail in the sub areas below.

(Note: some additional funds may be added to the budgets of new grants if the proposal requests the hire of US-citizen undergraduates as part-time and/or summer laboratory assistants. Please coordinate any requests with the Program Manager.)

1. Plasma and Electro-Energetic Physics

The objective of this program is to understand and control the interaction of electromagnetic energy and charged particles to produce useful work in a variety of arenas, including directed energy weapons, sensors and radar, electronic warfare, communications, novel compact accelerators, and innovative applications of plasma chemistry, such as plasma-enhanced combustion and plasma aerodynamics. While the focus of this effort is the generation and collective interaction of electromagnetic fields and plasmas, advances in the enabling technology of compact pulsed power, including innovative dielectric and magnetic materials for high-density energy storage, switching devices, and non-linear transmission lines are also of fundamental interest. Ideas for advancing the state-of-the-art in the following areas are strongly encouraged: highly efficient electron-beam-driven sources of microwave, millimeter-wave, and sub-millimeter coherent radiation (high power microwaves [HPM] and/or vacuum electronics), novel dispersion engineering via meta-material and photonic band gap structures, compact pulsed power, particle-field interaction physics, power-efficient methods to generate and maintain significant free-electron densities in ambient air, plasma chemistry at high pressure, and micro- and/or nano-device concepts based on coupling particle beam, pulsed power, and MEMS technology, especially for the development of “smart” microwave tubes. New concepts for the theory, modeling, and simulation of these physical phenomena are also of interest, including combined experimental/theoretical/simulation efforts that verify and validate innovative models.

Ideas relating to plasmas and electro-energetic physics in space are of interest to this program, but researchers should also consult the programs in Space Power and Propulsion and in Space Sciences as described in this Broad Area Announcement to find the best match for the research in question. Innovative science that combines plasma and electro-energetic physics with the high-energy density associated with nuclear forces (e.g. nuclear batteries where radiation produces currents in semiconductors and
propulsion plasmas sustained via fusion) will be considered. Nuclear fission or fusion for large-scale energy production is not of prime interest to this portfolio.

Interested parties are encouraged to contact the program manager before submission of white papers on their ideas. Collaborative effort with the researchers at the Air Force Research Laboratory is encouraged, but not required.

Dr. John W. Luginsland AFOSR/RSE
(703) 588-1775; DSN 425-1775
FAX (703) 696-8481
E-mail: john.luginsland@afosr.af.mil

2. Atomic and Molecular Physics

This program encompasses fundamental experimental and theoretical AMO (Atomic, Molecular and Optical) physics research that is primarily focused on studies of cold and ultracold quantum gases, precision measurement, ultra-fast and ultra-intense laser science, and quantum information science (QIS) with atoms, molecules, and light. These research areas support technological advances in application areas of interest to the Air Force, including precision navigation, timekeeping, remote sensing, secure communication, and metrology.

AMO physics today offers an unprecedented level of coherent control and manipulation of atoms and molecules and their interactions, allowing for significant scientific advances in the areas of cold and ultracold matter and precision measurement. Specific research topics of interest in this program include, but are not limited to, the following: physics of quantum degenerate atomic and molecular gases; strongly-interacting quantum gases; new phases of matter; non-equilibrium dynamics of cold quantum gases; cold/ultracold plasmas; ultracold chemistry; precision spectroscopy; novel clocks; and high-precision techniques for navigation, guidance, and remote sensing.

Quantum information science is a field that encompasses many disciplines of physics. AMO physics plays an important role in the development of QIS. This program is primarily focused on the following research areas in QIS: quantum simulation of strongly-correlated condensed-matter systems with cold atoms and molecules; enabling science for secure long-distance quantum communication; utilization of non-classical states of matter and light for high-precision metrology and sensing; realization of quantum states and observation of quantum behavior of macroscopic objects; application of controlled coherent interactions to direct the dynamics of quantum systems; and novel approaches to quantum information processing.

Laser pulses have reached intensities sufficient to drive electrons to relativistic speeds, and durations that are approaching time scales corresponding to atomic-scale electron dynamics. This presents enormous possibilities in the future for, e.g., next-generation microscopy and spectroscopy techniques to probe materials with unprecedented spatial
and temporal resolution. Attosecond pulses will enable, for example, observation of basic processes of chemistry and biology on the scale of a single molecule. Compact sources of X-rays and directed particle beams, enabled by ultra-fast ultra-intense laser pulses, will revolutionize the study of matter, with important implications for, e.g., medical and materials diagnostics. In this program we are interested in: (1) the development of novel attosecond-pulse sources, as well as compact short-wavelength (VUV to X-rays), and directed particle beam sources based on the interaction of ultra-fast ultra-intense laser pulses with matter; and (2) utilization of such sources to investigate processes and phenomena otherwise inaccessible in AMO physics, chemistry, biology, and materials science.

Dr. Tatjana Curcic, AFOSR/NE  
(703) 696-6204; DSN: 426-6204  
FAX: (703) 696-8481  
E-mail: tatjana.curcic@afosr.af.mil

3. Multi-scale Modeling

This program supports research in the mathematics of molecular/atomic to continuum (linear and nonlinear partial differential equations) descriptions of media in order to develop accurate models of physical phenomena to enhance the fidelity of simulation. It conceives and investigates the properties of mathematical approaches which can provide direct passages from molecular/atomic level to continuum level descriptions (for example emphasizing suitable functional analytic approaches).

Dr. Arje Nachman AFOSR/RSE  
(703) 696-8427; DSN 426-8427  
FAX (703) 696-8450  
E-mail: arje.nachman@afosr.af.mil

4. Electromagnetics

Conduct research in electromagnetics to produce conceptual descriptions of electromagnetic properties of novel materials/composites (such as photonic band gap media or negative index media) and simulate their uses in various operational settings. Evaluate methods to recognize (the inverse scattering problem) and track targets (including Improvised Explosive Devices) and to penetrate tree covers, clouds, buildings, the ionosphere, or other dispersive/random/turbulent media with wide band radar (propagation of precursors for example) and design transmitters to produce such pulses. Develop computational electromagnetic simulation codes that are rapid and accompanied by rigorous error estimates/controls. Also pursue descriptions of nonlinear EM phenomena such as the propagation of ultrashort laser pulses through air, clouds, etc and any possible exploitation of these pulses. Such mathematical descriptions are anticipated to be a coupled system of nonlinear partial differential equations. Other nonlinear phenomena include the dynamics of the EM field within solid state laser
cavities as well as the propagation of light through various nonlinear crystals and other nonlinear optical media. Such modeling/simulation research is complementary to the experimental/empirical portfolios within the Physics & Electronics Directorate. Another area of interest is the description and understanding of any chaos in circuitry which can possibly be created by exposure to suitable EM fields.

Dr. Arje Nachman AFOSR/RSE
(703) 696-8427; DSN 426-8427
FAX (703) 696-8450
E-mail: arje.nachman@afosr.af.mil

5. Laser and Optical Physics

This Air Force program seeks innovative approaches and novel concepts that could lead to transformational advances in high average power lasers for future applications related to directed-energy. Examples of such areas include novel processing techniques for high quality ceramic laser materials with control over spatial distributions of dopants and index of refraction, and processing methods for achieving low loss laser ceramics with non-isotropic, and therefore necessarily aligned, grains. Aligned grain ceramic materials are also of interest as large size, high average power nonlinear optical materials using quasi-phasematching techniques. New ideas for high average power fiber lasers are of interest, including new materials, and large mode area structures, novel ways of mitigating nonlinear issues, and studies of coupling multiple fiber lasers which can withstand very high average power. Novel compact, particularly tunable or wavelength flexible, potentially inexpensive, infrared lasers are of interest for infrared countermeasures or for gas sensing applications. In this regard infrared frequency combs are also of interest. The Laser and Optical Physics program is interested in ultrafast and ultrashort pulse laser physics, device research, and research applications, and closely collaborates with the Atomic, Molecular and Optical Physics program (see its description in this BAA) in this regard. Relatively small novel sources of monochromatic x-rays are also of interest. The Laser and Optical Physics program is interested and will consider any novel and potentially transformational ideas within the broad confines of its title.

(703) 696-7549; DSN 426-7549
FAX (703) 696-8481
E-mail: howard.schlossberg@afosr.af.mil

6. Remote Sensing and Imaging Physics

This program investigates fundamental issues concerning remote sensing and the physics of imaging, including image formation processes, non-imaging sensing, propagation of electromagnetic radiation, the interaction of radiation with matter, remote
target detection and identification, the interaction of Air Force imaging systems and sensors with the space environment, and the detection and tracking of resident space objects (RSOs), including orbital prediction and dynamics. Proposals are sought in all areas of ground, air, and space-based remote sensing and imaging, but particularly in the detection, characterization, and identification of space objects. This program includes the investigation of fundamental processes that affect space situational awareness. Technological advances are driving the requirement for innovative methods to detect, identify, and predict trajectories of smaller and/or more distant objects in space. New optical capabilities that complement traditional radar tracking of RSOs, as well as increased resolution and sensitivity, are leading to the need for new and better methods of characterization. Research goals include, but are not limited to:

1. Theoretical foundations of remote sensing and imaging.
2. Enhancement of remote sensing capabilities, including novel solutions to system limitations such as limited aperture size, imperfections in the optics, and irregularities in the optical path.
3. Propagation of coherent and incoherent electromagnetic radiation through a turbulent atmosphere. (Theoretical and mathematical aspects of this area should also see the BAA input for Dr. Nachman.)
4. Innovative methods of remote target location, characterization, and tracking, as well as non-imaging methods of target identification.
5. Understanding and predicting dynamics of space objects as it relates to space object identification and space situational awareness.
6. Rigorous theory and models to describe the spectral and polarimetric signature from targets of interest using basic material physical properties with the goal of providing better understanding of the physics of the reflection or emission and the instrumentation requirements for next generation space surveillance systems.
7. Remote sensing signatures and backgrounds of both ground-based and space-based observations.
8. The interaction of Air Force imaging systems and sensors with the space environment. This includes the understanding of conditions that affect target identification, such as environmental changes and surface aging or weathering.

Dr. Kent Miller AFOSR/RSE
(703) 696-8573; DSN 426-8573
FAX (703) 696-8481
E-mail: kent.miller@afosr.af.mil

7. Space Sciences

The AFOSR Space Sciences program supports basic research on the solar-terrestrial environment extending from the Sun through Earth’s magnetosphere and radiation belts to the mesosphere and lower thermosphere region. This geospace system is subject to solar radiation, particles, and eruptive events, variable interplanetary magnetic fields, and cosmic rays. Perturbations to the system can disrupt the detection and tracking of
aircraft, missiles, satellites, and other targets; distort communications and navigation signals; interfere with global command, control, and surveillance operations; and negatively impact the performance and longevity of Air Force space assets.

A long-term goal for the program is development of a physics-based predictive coupled solar-terrestrial model that connects solar activity and emissions with resultant effects on Earth’s radiation belts, magnetosphere, ionosphere, and neutral atmosphere. To achieve this, fundamental research focused on improving understanding of the physical processes in the geospace environment is encouraged. Particular goals are to improve operational forecasting and specification of solar activity, thermospheric neutral densities, and ionospheric irregularities and scintillations. Activities that support these goals may include validating, enhancing, or extending solar, ionospheric, or thermospheric models; investigating or applying data assimilation techniques; and developing or extending statistical or empirical models. An important aspect of the physics is understanding and representing the coupling between regions, such as between the solar corona and solar wind, between the magnetosphere and ionosphere, between the lower atmosphere and the thermosphere/ionosphere, and between the equatorial, middle latitude, and polar regions.

Research areas of interest include:

• The structure and dynamics of the solar interior and its role in driving solar eruptive activity;
• The mechanism(s) heating the solar corona and accelerating it outward as the solar wind;
• The triggers of coronal mass ejections (CMEs), solar energetic particles (SEPs), and solar flares;
• The coupling between the solar wind, the magnetosphere, and the ionosphere;
• The origin and energization of magnetospheric plasma;
• The triggering and temporal evolution of geomagnetic storms;
• The variations in solar radiation received at Earth and its effects on satellite drag;
• The impacts of geomagnetic disturbances on the thermosphere and ionosphere;
• Electron density structures and ionospheric scintillations;
• Ionospheric plasma turbulence and dynamics;
• The effects of neutral winds, atmospheric tides, and planetary and gravity waves on the neutral atmosphere densities and on the ionosphere.

Researchers are strongly encouraged to submit short white papers (three pages max) prior to developing full proposals. White papers should briefly describe the proposed effort and how it will advance the current state-of-the-art. It should include a list of any collaborators and an approximate yearly cost for the effort.

Dr. Cassandra Fesen AFOSR/RSE
(703) 696-8315; DSN 425-8315
FAX (703) 696-8481
8. Quantum Electronic Solids

This program focuses on materials that exhibit cooperative quantum electronic behavior. The primary emphasis is on superconductors, metamaterials, and on nanoscopic electronic devices based mainly upon graphene, and on pure and doped nanotubes, with low power dissipation and the ability to provide denser non-volatile memory, logic and/or sensing elements that have the potential to impact future Air Force electronic systems.

The superconductivity portion of this program is now wholly devoted to a search for new classes of superconducting materials that either have higher transition temperatures or have isotropic superconducting properties at temperatures in the range of the transition temperatures of the cuprates, e.g., YBCO. While the 2008 discovery of iron-pnictide superconductors has provided new insights, these materials are not sufficiently promising. This major change in emphasis is part of a coordinated international activity that is multidisciplinary in nature, and proposals that address both the physics and chemistry of potential new types of superconductors are welcome, as are multinational research efforts. However, major awards under this program were made in FY09, so while any promising new ideas will be considered, funding for new projects in this area will be somewhat limited for the next couple of years. The program is primarily on experimental research, but theorists who interact with experimental groups constructively are welcome. The primary goal of this part of the program is to uncover superconducting materials that can be made into forms that are amenable to Air Force applications.

The metamaterials portion of this program is devoted to the production of 2-D and 3-D metamaterials that operate over a wide swath of the electromagnetic spectrum, from microwaves, to IR and the visible. The long-term goal is to produce materials that improve the efficiency and selectivity of, and reduce the size of communications system components such as antennas, filters and lenses. Another important aspect is to study the ability to create sub-wavelength, near-field (and possibly far-field) imaging. These desired properties could lead to denser information storage and retrieval.

A relatively minor part of this program is the inclusion of nanoscopic techniques to fabricate, characterize, and manipulate atomic, molecular and nanometer-scale structures (including graphene, and nanotubes of carbon and other elements), with the aim of producing a new generation of improved communications components, sensors and non-volatile, ultra-dense memory, resulting in the ultimate miniaturization of analog and digital circuitry. This aspect of the program includes the use of polarized electrons to produce nuclear magnetic polarization as a basis for dense, non-volatile memory, with possible application to quantum computing at room temperature.

Finally, there is a continuing (albeit small) interest in the development of new soft and hard magnetic material with high energy product at elevated temperatures to aid in
providing power devices, switches and bearings for a new generation of more-electric aircraft that dispense with hydraulics and which rely heavily on magnetic actuation.

Dr. Harold Weinstock AFOSR/RSE  
(703) 696-8572; DSN 426-8572  
FAX (703) 696-8481  
E-mail: harold.weinstock@afosr.af.mil

9. Adaptive Multimodal Sensing and THz-Speed Electronics

This program seeks to discover and exploit scientific breakthroughs in solid-state nano and micro materials and structures, hetero-interface property design and control, and novel device physics concepts and methods that are vitally important for game-changing capability leaps in near real-time adaptive multimodal sensing, THz-speed data processing, and ultra-high bandwidth communications. Such leaps are crucial for long-term USAF C4ISR capability breakthroughs. Research proposals are sought that address high-risk, high-payoff topics having fundamental challenges that are scientifically interesting as well as technologically relevant. The current research portfolio is organized in two thrusts:

I) Adaptive Multimodal Sensing (UV-IR): Emerging Air Force universal situational awareness requirements include near real-time detection, tracking, and ID of low-contrast targets in broad areas and highly-cluttered dynamic environments, integrated with near real-time communication of resultant actionable data to battlefield commanders. Such near instantaneous sensor-to-shooter capability will require novel remote platform-based closed-loop target-spectra sensing and data processing, fusion, and exploitation. A very interesting and promising approach for achieving this is ‘performance-driven sensing,’ which relies on sensing, processing, and exploiting only the most ‘decision-relevant’ sets of target data in order to reduce by orders-of-magnitude requirements on image data processing-throughput and communications bandwidth. The key to this approach is the ability to autonomously, dynamically, and in near-real-time select and process data from the most judicious sets of same-platform sensor pixels (spatial locations) and pixel photon modes (wavelength, polarization, and perhaps phase information), as well as the fusion and exploitation of data collected across multiple sensor platforms. It’s a well know fact that the fusion and exploitation of optimum sets of multi-modal target spectra data can exponentially quicken target ID, dramatically improve ID fidelity, and reduce false alarms. Today, however, two capabilities essential for decision-relevant sensing don’t yet exist; adaptive (pixel & mode tune or reconfigure) multimode-pixel (spatial, spectral, polarization, etc.) sensing capabilities, and autonomous data processing and exploitation algorithms for closed-loop sensor mode control. Hence, the focus of this first research thrust is on the key fundamental materials science and device physics challenges currently facing the realization of adaptive multimodal sensing phenomenology and functionality. The many challenges associated with the optimum decision making part of the ‘performance-driven sensing’ problem, e.g., information and cognitive science, are currently being worked by other AFOSR PMs.
**Challenges:** Fundamental materials challenges facing multimodal sensing-in-a-pixel concepts are primarily driven by incompatible optical and electronic interactions at complex interfaces between different multi-discriminate photon-absorber materials, where lattice-mismatched layers yield structural and electrical defects, and interface electronic band-discontinuities yield deleterious electronic potential barriers. Thus, the primary areas of interest include 1) novel methods to circumvent deleterious effects of heterogeneous semiconductor materials and structures integration, 2) novel approaches for real-time dynamic material property tuning, 3) approaches for combining multi-D nano/micro structures to obtain new device functionalities, 4) new phenomenological interactions between electromagnetic (optical) and electronic states of novel materials and structures, 5) methods to manipulate material and interface band- and defect-structure to enable optical and electronic property engineering, such as wavelength absorption edge, carrier transport and collection efficiency, and noise/dark current levels that drive sensor operating temperature, and 6) novel methods for synthesizing monolithic linearly-graded semiconductor layers with bandgaps spanning the range of 0.3 - 4.0 eV.

In addition, novel sensing concepts and methods are desired for achieving co-bore sighted multimodal spectra imaging in a starring format, as well as non-imaging detection and discrimination techniques. Novel concepts are sought for tunable and/or reconfigurable 'pixel' and/or detector element approaches offering multiple-modes in one or more UV-IR bands; novel concepts for same-pixel multicolor (4+ bands) architectures with suitable pixel-to-ROIC interconnect schemes; and novel biologically inspired detection processes and concepts. Possible detector structures include, but are not limited to, integrated monolithic and/or hybrid approaches utilizing homogeneous and/or heterogeneous material layers and structures; multi-D quantum and nano-based structures, and any combination thereof, with a requirement that device concepts should have a reasonable expectation of yielding external quantum efficiencies in excess of 50%.

**II) THz-Speed Electronic Materials & Methods:** This thrust is directed toward discovering and exploiting advanced electronic, optoelectronic, and magnetic materials, structures, and methods with an eye on breakthrough applications in ultra-high throughput THz-speed logic and near-THz-speed power devices. Exponential advanced in both areas are crucial for meeting long-term USAF C4ISR capabilities needs. This thrust is organized into two challenge areas; materials and materials-integration. The materials component is focused on growth and use of semiconductors, magnetic alloys, and specialized dielectrics in bulk structures, heterostructures, quantum wells, superlattices, quantum wires, and quantum dots. Novel approaches and methods are sought for significant advances in these areas, or expansion to novel device application of materials with estimates comparing potential improvements to present capabilities and the impact on USAF capabilities. Multifunctional materials which combine optical, electronic, ferromagnetic and/or piezoelectric properties are also of high interest. The materials-integration component of this thrust focuses on integration of heterogeneous semiconducting, dielectric, and metallic layers and structures having different crystal structures, lattice parameters, and/or thermal expansion coefficients,
where the paramount challenge is devising novel methods to minimize the interfacial strain that drives atomic dislocations and electrical defects. Primary areas of interest include 1) investigate the unique physical and electrical properties of 2-D III-V semiconductor nanostructure interface-templates and techniques for promoting lateral epitaxial overgrowth to minimize stress and eliminate threading dislocations, 2) investigate the physical and electrical properties and 3-D III-V nanostructures such as coaxial nanorods and nanowires for use as coalescence templates for defect-free overgrowth as well as current transport-conduits for bridging the high defect density interface regions, 3) explore the unusual properties of multi-phase III-V-based spinodal nano-decomposition clusters whose shape can potentially be controlled to yield heterogeneous layer current conduction conduits and electrical contacts, and whose electronic bandgap can be tailored for optical property tuning, 4) novel hetero-interface formation methods using non-thermodynamic equilibrium conditions to potentially yield entirely new classes of hetero-semiconductor structures having unusual stoichiometries and bond geometries, and 5) novel methods for real-time dynamic tuning material and device parameters such as bandgap, potential-barriers, confined states in multi-D quantum/nano structures, etc., through new understanding of chemical and physical factors controlling parameter variation and transitions in response to applied stimulus (e.g., electric and magnetic fields, charge injection, phonon injection, mechanical stress, and possible combinations thereof).

Dr. Kitt Reinhardt, AFOSR/RSE

FAX (703)696-8481
E-mail: kitt.reinhardt@afosr.af.mil

10. Optoelectronics: Components, Integration and Information Processing and Storage

The major objective is to explore new fundamental concepts in photonics, improve the fundamental understanding of photonic devices and components, and enable discovery and innovation in advancing the frontier of nanophotonics and associated nanoscience and nanotechnology.

This program supports Air Force requirements for information dominance by increasing capabilities in image capture; processing, storage, and transmission for surveillance, communications and computation; target discrimination; and autonomous navigation. In addition, high bandwidth interconnects enhance performance of distributed processor computations that provide real-time simulation, visualization, and battle management environments. Further important considerations for this program are the airborne and space environment in which there is a need to record, read, and change digital data at extremely high speeds. Six major areas of interest include Optoelectronic Components and Information Processing, Nanophotonics (including photonic crystals, plasmonics, metamaterials), Compact Terahertz Sources and Detectors, Optical Buffering and Storage, Quantum Computing using Optical Approaches, and Reconfigurable Photonics.
The thrusts in components and information processing include investigations in two affiliated areas: (1) the development of optoelectronic devices and supportive materials and processing technology, and (2) the insertion of these components into optoelectronic computational, information processing and imaging systems. Device exploration and architectural development for processors are coordinated; synergistic interaction of these areas is expected, both in structuring architectural designs to reflect advancing device capabilities and in focusing device enhancements according to system needs. Research in optoelectronic or photonic devices and associated optical material emphasizes the insertion of optical technologies into computing, image-processing, and signal-processing systems. To this end, this program continues to foster interconnection capabilities, combining arrays of sources or modulators with arrays of detectors, with both being coupled to local electronic or potentially optical processors. Understanding the fundamental limits of the interaction of light with matter is important for achieving these device characteristics. Semiconductor materials, insulators, metals and associated electromagnetic materials and structures are the basis for the photonic device technologies. Numerous device approaches (such as silicon photonics) are part of the program as are techniques for optoelectronic integration.

The program is interested in the design, growth and fabrication of nanostructures that can serve as building blocks for nano-optical systems. The research goals include integration of nanocavity lasers, filters, waveguides, detectors and diffractive optics, which can form nanofabricated photonic integrated circuits. Specific areas of current interest include nanophotonics, use of nanotechnology in photonics, exploring light at the nanoscale, nonlinear nanophotonics, plasmonics & excitonics, sub-wavelength components, photonic crystal and negative index materials, optical logic, optical signal processing, reconfigurable nanophotonics, nanophotonics enhanced detectors, chip scale optical networks, integrated nanophotonics and silicon-based photonics. Coupled somewhat to these areas are optoelectronic solutions to enable practical quantum computing schemes plus novel approaches to nanopower such as thermoelectrics.

In bridging the gap between electronics and photonics the program also explores opportunities in terahertz (THz) technologies and its associated applications in non-destructive evaluation, communications, navigation aids, and security. Diverse approaches have been taken to create THz sources and detectors over the 0.3 to 10 THz range. Desired are THz sources and detectors that are compact, room-temperature, efficient, solid-state devices capable of integration with other solid-state components. Integration of transmit and receive functions on the same chip is another goal.

To support next generation processor architectures, image processing and capture and new multi-media application software, computer data buffering and storage research is needed. As devices are being developed that emit, modulate, transmit, filter, switch, and detect multi-spectral signals, for both parallel interconnects and quasi-serial transmission, it is important to develop the capability to buffer, store, and retrieve data at the rates and in the quantity anticipated by these devices. Architectural problems are also of interest that include, but are not limited to, optical access and storage in memory devices to
obviate capacity, access latency, and input/output bandwidth concerns. Of interest has been the ability to slow, store, and process light pulses. Materials with such capabilities could be used for tunable optical delay lines, optical buffers, high extinction optical switches, novel image processing hardware, and highly efficient wavelength converters.

Dr. Gernot Pomrenke AFOSR/RSE
(703) 696-8426; DSN 426-8426
FAX (703) 696-8481
E-mail: gernot.pomrenke@afosr.af.mil

This research activity is concerned with the systematic analysis and interpretation of variable quantities that represent critical working knowledge and understanding of the changing Battlespace. “Signals Communication” is a sub-area referring to the conveyance of information physically through a channel. Surveillance images are of special importance in targeting, damage assessment and resource location. Signals are either generated naturally or deliberately transmitted, propagated as electromagnetic waves or other media, and recaptured at the receiving sensor. Modern radar, infrared, and electro-optical sensing systems produce large quantities of raw signaling that exhibit hidden correlations, are distorted by noise, but still retain features tied to their particular physical origin. Statistical research that treats spatial and temporal dependencies in such data is necessary to exploit its usable information. An outstanding need in the treatment of signals is to develop resilient algorithms for data representation in fewer bits (compression), image reconstruction/enhancement, and spectral/frequency estimation in the presence of external corrupting factors. These factors can involve deliberate interference, noise, ground clutter, and multi-path effects. This AFOSR program searches for application of sophisticated mathematical methods, including time-frequency analysis and generalizations of the Fourier and wavelet transforms, that deal effectively with the degradation of signaling transmission across a channel. These methods hold promise in the detection and recognition of characteristic transient features, the synthesis of hard-to-intercept communications links, and the achievement of faithful compression and fast reconstruction for audio, video, and multi-spectral data. New combinations of known methods of asset location and navigation are being sought, based on analysis and high-performance computation that bring a force-multiplier effect to command/control capabilities. Continued upgrade and reliance on Global Positioning System makes is critical to achieve GPS-quality positioning in situations GPS by itself is not sufficient. Ongoing research in Inertial and non-Inertial navigation methods (including optical flow and use of signals of opportunity) will bring location precision and reliability to a superlative level. Continuous improvement in its repertoire of signal processing and statistical tools will enable the Air Force to maintain its lead in Battlespace awareness through navigation and surveillance. Communications are what hold together the networked Infosphere and cost-effective systems innovations that enable phenomenal air power projection.
12. Dynamic Data Driven Applications Systems (DDDAS)

Program Description: The DDDAS concept entails the ability to dynamically incorporate additional data into an executing application, and in reverse, the ability of an application to dynamically steer the measurement (instrumentation and control) components of the application system. DDDAS is a key concept for improving modeling of systems under dynamic conditions, more effective management of instrumentation systems, and is a key concept in architecting and controlling dynamic and heterogeneous resources, including, sensor networks, networks of embedded controllers, and other networked resources. DDDAS transformative advances in computational modeling of applications and in instrumentation and control systems (and in particular those that represent dynamic systems) require multidisciplinary research, and specifically need synergistic and systematic collaborations between applications domain researchers with researchers in mathematics and statistics, researchers computer sciences, and researchers involved in the design/implementation of measurement and control systems (instruments, and instrumentation methods, and other sensors and embedded controllers).

Basic Research Objectives: individual and multidisciplinary research, technology development, and cyberInfrastructure software frameworks needed for DDDAS applications and their environments are sought, along four key science and technology frontiers: Applications modeling: In DDDAS an application/simulation must be able to accept data at execution time and be dynamically steered by such dynamic data inputs. This requires research advances in application models that: describe the application system at different levels of detail and modalities; are able to dynamically invoke appropriate models as needed by the dynamically injected data into the application; and include interfaces of applications to measurements and other data systems. DDDAS will for example engender an integration of large scale simulation with traditional controls systems methods, thus provide an impetus of new directions to traditional controls methods. Advances in Mathematical and Statistical Algorithms include creating algorithms with stable and robust convergence properties under perturbations induced by dynamic data inputs: algorithmic stability under dynamic data injection/streaming; algorithmic tolerance to data perturbations; multiple scales and model reduction; enhanced asynchronous algorithms with stable convergence properties; multimodal, multiscale modeling and uncertainty quantification, and in cases where the multiple scales or modalities are invoked dynamically and there is need for fast methods of uncertainty quantification and uncertainty propagation across dynamically invoked models. Such aspects push to new levels of challenges the traditional computational math approaches. Application Measurement Systems and Methods include improvements and innovations in instrumentation platforms, and improvements in the means and methods for collecting data, focusing in a region of relevant measurements,
controlling sampling rates, multiplexing, multisource information fusion, and determining the architecture of heterogeneous and distributed sensor networks and/or networks of embedded controllers. The advances here will create new instrumentation and control capabilities. Advances in Systems Software runtime support and infrastructures to support the execution of applications whose computational systems resource requirements are dynamically dependent on dynamic data inputs, and include: dynamic selection at runtime of application components embodying algorithms suitable for the kinds of solution approaches depending on the streamed data, and depending on the underlying resources, dynamic workflow driven systems, coupling domain specific workflow for interoperation with computational software, general execution workflow, software engineering techniques. The systems software environments required are those that can support execution in dynamically integrated platforms ranging from the high-end to the real-time data acquisition and control - cross-systems integrated. Software Infrastructures and other systems software (OS, data-management systems and other middleware) services to address the “real time” coupling of data and computations across a wide area heterogeneous dynamic resources and associated adaptations while ensuring application correctness and consistency, and satisfying time and policy constraints. Specific features include the ability to process large volume, high rate data from different sources including sensor systems, archives, other computations, instruments, etc.; interfaces to physical devices (including sensor systems and actuators), and dynamic data management requirements.

Areas of interest to the AF, which can benefit from DDDAS transformative advances, include: areas driven by the AF Technology Horizons report, including: autonomous systems (e.g. swarms of unmanned or remotely piloted vehicles); autonomous mission planning; complex adaptive systems with resilient autonomy; collaborative/cooperative control; autonomous reasoning and learning; sensor-based processing; ad-hoc, agile networks; multi-scale simulation technologies and coupled multi-physics simulations; decision support systems with the accuracy of full scale models (e.g. high-performance aircraft health monitoring, materials stresses and degradation); embedded diagnostics and V&V for complex adaptive systems; automated software generation; cognitive modeling; cognitive performance augmentation; human-machine interfaces. Other examples include: Advanced electromagnetic sources with extremely high power densities, leading to a variety of phenomena such as plasma formation, require holistic approaches to very large data sets (>1TB) and incorporate nonlinear, multi-scale, and multi-physics effects in a common framework. DDDAS provides new approaches for combining computational, theoretical, and experimental data sets for high interactive testing of multiple physical hypotheses at once.

Programmatic activities that will be launched under this initiative will support research in individual areas, but mostly in the context of multidisciplinary research across two of the four components above, or at least two of the four.

Dr. Frederica Darema, AFOSR/RSE (703) 588-1926
DSN 426-7551 FAX (703) 696-8450
E-mail: frederica.darema@afosr.af.mil
Mathematics, Information, and Life Sciences (RSL)

The Directorate is responsible for research activities in mathematics, information and life sciences. A wide range of fundamental mathematics, information and computer science, biological sciences, and human behavioral/performance research are supported to provide novel options that increase operational flexibility and performance of systems and environments of relevance to the Air Force. The Directorate is responsible for research primarily encompassed in four of the ten focus areas outlined in the AFOSR Strategic Plan. The four areas and their descriptions are as follows:

Information and Complex Networks Research: This area focuses on research required to enable reliable and secure exchange of information and predictable operation of networks and systems. Though it includes traditional aspects of information assurance and research into reliable systems, the emphasis is on the mathematics that underlies fundamental new secure-by-design architectures of networked communications and decision-making platforms. Subareas that support this scientific focus area are system and network performance prediction, design, and analysis; information operations and security; and modeling of human-machine systems.

Decision-Making Research: This thrust focuses on the discovery of mathematical laws; foundational scientific principles; and new, reliable and robust algorithms that underlie intelligent, mixed human-machine decision-making to achieve accurate real-time projection of expertise and knowledge into and out of the battlespace. It includes both efforts to advance the critical knowledge base in information sciences and information fusion and models of individual and group cognitive processing and decision-making.

Dynamical Systems, Optimization, and Control Research: This area emphasizes mathematical research for discovering new scientific concepts supported by rigorous analysis for advancing the science of autonomy and promoting the understanding necessary to analyze and design complex multiscale systems as well as provide guaranteed levels of performance. It includes novel adaptive control strategies for coordinating heterogeneous autonomous or semi-autonomous aerospace vehicles in uncertain, information rich, dynamically changing, adversarial, and networked environments.

Natural Materials and Systems Research: This area focuses on multidisciplinary approaches for studying, using, mimicking, or altering the novel ways that natural systems accomplish their required tasks. Nature has used evolution to build exquisite materials and sensors that often outperform manmade versions. This scientific thrust discovers how to mimic existing natural sensory systems, and adds existing capabilities to these organisms for more precise control over their material production.

The program descriptions that follow address specific sub-areas of interest as well as explore novel ideas to bridge disciplines across the research scoped through the four broad areas above. Many critical research activities fostered under the programs discussed here are multidisciplinary and involve support from the other scientific directorates within AFOSR. Research at the interfaces across disciplines often provides insights necessary for and leading
to new technological advances. Creativity is highly encouraged in proposing novel scientific approaches for our consideration.

1. Computational Mathematics

Program Description: This program seeks to develop innovative mathematical methods and fast, reliable algorithms aimed at making radical advances in computational science. Research in computational mathematics underpins foundational understanding of complex physical phenomena and leads to capabilities for analysis and prediction of phenomena crucial to design and control of future Air Force systems and processes. Proposals to this program should focus on fundamental scientific and mathematical innovations. Additionally, it is desirable to frame basic research ideas in the context of applications of relevance to the Air Force which can serve simultaneously to focus the research and to provide avenues for transition of basic research outcomes into practice. Applications of current interest include, but are not limited to, unsteady aerodynamics, plasma dynamics, propulsion, combustion, directed energy, information science, and material science.

Basic Research Objectives: Research under this program has traditionally emphasized schemes that address the discretization and numerical solution of complex systems of equations, generally partial differential equations that arise from physics. Nevertheless, alternative phenomenological models and computational approaches are of interest, particularly in connection with emerging applications involving information, biological, and social sciences. One area of increasing emphasis is simulation of complex systems with dynamic data integration. Issues such as multiscale and multi-modal description of the system, dynamic invocation of appropriate models based on interjection of data into the simulation systems, stable and convergent algorithms which are robust under perturbations from dynamic-data inputs, and Uncertainty Quantification (UQ) analysis for these systems are of importance. To meet the formidable computational challenges entailed in simulating nonlinear, discontinuous, multi-physics and multi-scale problems of interest to the Air Force, the program is examining numerical algorithms that include multi-scale and multi-physics approaches with particular emphasis on convergence, error analysis, and adaptivity. A spectrum of numerical methods in these areas are being developed and improved within the scope of the program, including high-order spatial and temporal algorithms, mesh-free and particle methods, high-order moving interface algorithms, and hybrid methods. The other areas of interest are rigorous model reduction techniques with quantifiable fidelity for efficient and robust multidisciplinary design and optimization, scalable algorithms for multi-core platforms and also uncertainty quantification. The active areas of interest in UQ include development of high accuracy stochastic numerical methods, stochastic model reduction and long term integration techniques. Given the emerging computing platforms, including multicore-based platforms with complex architectures, the program is considering fundamental research on the mathematical aspects of scalable solvers with emphasis on parallelism across scales, high-order discretization, and multi-level domain decomposition techniques. Research in the Computational Mathematics program also supports the national program in high performance computing.

Dr. Fariba Fahroo AFOSR/RSL (703) 696-8429
2. Dynamics and Control

Program Description: This program emphasizes the interplay of dynamical systems and control theories with the aim of developing innovative synergistic strategies for the design and analysis of controlled systems that enable radically enhanced capabilities, including performance and operational efficiency for future Air Force systems. Proposals should focus on the fundamental science and mathematics, but should include connectivity to appropriate Air Force applications. These applications currently include information systems, as well as autonomous/semi-autonomous aerial vehicles, munitions, and space vehicles.

The dramatic increase in complexity of Air Force systems provides unique challenges for the Dynamics and Control Program. Meeting these challenges may require interdisciplinary approaches as well as deeper studies within single disciplines. Lastly, note that the Dynamics and Control Program places special emphasis on techniques addressing realistic treatment of applications, complexity management, semi-autonomous systems, and real-time operation in stochastic and adversarial environments.

Basic Research Objectives: Current research interests include: adaptive control and decision making for coordinated autonomous/semi-autonomous aerospace vehicles in uncertain, information rich, dynamically changing, networked environments; understanding how to optimally include humans in the design space; novel schemes that enable challenging multi-agent aerospace tracking in complex, cluttered scenarios; robust and adaptive non-equilibrium control of nonlinear processes where the primary objective is enhanced operability rather than just local stability; new methods for understanding and mitigating the effects of uncertainties in dynamical processes; novel hybrid control systems that can intelligently manage actuator, sensor, and processor communications in a complex, spatially distributed and evolving system of systems; sensor rich, data driven adaptive control; novel approaches and methods where dynamic resources in sensor networks and networks of controllers are adaptively managed through a dynamic feed-back loop symbiotically integrating simulations and models with real-time data-acquisition and control systems; managing adversarial and stability issues for systems in cyberspace; applying control concepts motivated by studies of biological systems; and the control of unsteady fluid-structure interactions.

In general, support in the program for research in linear systems theory is declining, while interest in the control of complex, multi-scale, hybrid, highly uncertain nonlinear systems is increasing. Further, new mathematics in clear support of dynamics and control is of fundamental importance. In this regard, some areas of interest include, but are not limited to, stochastic and adversarial systems, partial and corrupted information, max-plus and idempotent methods, game theory, nonlinear control and estimation, and novel computational techniques specifically aimed at games, control and systems theory.

Dr. Fariba Fahroo AFOSR/RSL (703) 696-8429
DSN 426-8429 FAX (703) 696-7360
E-Mail: fariba.fahroo@afosr.af.mil
3. Optimization and Discrete Mathematics

Program Description: The program goal is the development of mathematical methods for the optimization of large and complex models that will address future decision problems of interest to the Air Force. Areas of fundamental interest include resource allocation, planning, logistics, engineering design and scheduling. Increasingly, the decision models will address problems that arise in the design, management and defense of complex networks, in robust decision making, in performance, operational efficiency, and optimal control of dynamical systems, and in artificial intelligence and information technology applications.

Basic Research Objectives: There will be a focus on the development of new nonlinear, integer and combinatorial optimization algorithms, including those with stochastic components. Techniques designed to handle data that are uncertain, evolving, incomplete, conflicting, or overlapping are particularly important.

As basic research aimed at having the broadest possible impact, the development of new computational methods will include an emphasis on theoretical underpinnings, on rigorous convergence analysis, and on establishing provable bounds for (meta-) heuristics and other approximation methods.

Dr. Donald Hearn AFOSR/RSL (703) 696-1142
DSN 426-1142 FAX (703) 696-7360
E-Mail: donald.hearn@afosr.af.mil

4. Systems and Software

Program Description: The program is seeking proposals with ideas engendering transformational research in systems software to address the growing scale of software supporting Air Force systems and platforms and meet future Air Force needs in the air, space, and cyber domains. To this end, the program is seeking to foster bold, new basic research that addresses the design, creation, and employment of software-intensive systems. Broad areas of interest include disciplinary and mostly multidisciplinary research on: 1) software methods to support distributed, heterogeneous platforms, as well as need for capabilities for autonomic systems, resilient autonomy, adaptive software systems, and verification for software systems; 2) new, multi-level and multi-modal approaches as well as representations, abstractions, and composition of models and measurements into comprehensive software frameworks to represent and manage the diverse interactions among the software, the systems on which the software resides, and the dynamic environments in which these systems operate, and in particular as such capabilities apply to support; 3) Human-in-the-loop interacting with, and supported by, such software systems, and autonomous reasoning and learning.

Basic Research Objectives: In the area of distributed computational platforms and their environments, transformative opportunities derived from exploiting the next generation of multicore-based systems and new paradigms of complex applications' computational approaches motivate fundamental research in programming environments, application development, and compiler/runtime support. Of particular interest are directions and efforts on
new compiler-embedded-in-the-runtime approaches ("runtime-compiler") to support adaptive and optimized application mapping, runtime, and composition. Environments motivating us to address such research consist of distributed and heterogeneous computational platforms ranging from the high-end to small clusters, as well as emerging unified computational environments which dynamically integrate high-end systems with real-time data-acquisition and control systems (including those spanning emerging peta- and exascale-range platforms on the high-end side, and networks of heterogeneous sensors and networks of controllers, on the data-acquisition and control side, all of which will be multicore-based). These classes of platforms will exhibit multilevel heterogeneity in terms of their processor interconnects, memory-levels, and latencies. They will entail environments where the resources available to and required by the executing applications will vary during execution. New insights are also sought into the human's role and interactions with heterogeneous software: we seek new theories for modeling and developing systems that have human and machine components. It is important to consider integrated modeling approaches that jointly address the hardware, software, and human components of large-scale systems. Realization of these mixed-component (human-machine) systems may also require new approaches to how computation itself is modeled or even an entirely new understanding of computation.

Dr. Robert Bonneau AFOSR/RSL (703) 696-9545
DSN 426-9545, FAX (703) 696-7360
E-mail: robert.bonneau@afosr.af.mil

5. Complex Networks

Program Description: Network behavior is influenced at many levels by fundamental theories of information exchange in the network protocols and policies developed. The Complex Networks program seeks to understand mathematically how such fundamental approaches to information exchange influence overall network performance and behavior. From this analysis we wish to develop strategies to assess and influence the predictability and performance of heterogeneous types of Air Force communication networks that must provide reliable transfer of data in dynamic, hostile and high interference environments. Accordingly, we wish to develop approaches to describe information content, protocol, policy, structure, and dynamic behavior of a network by mathematically connecting observed network data to analytic and geometric representation. We can then exploit such mathematical tools in the formulation of network design and engineering approaches in areas such as information and communication theory, signal processing, optimization, and control theory. Examples of such tools might include methods derived from algebraic geometry, algebraic statistics, spectral graph theory, sparse approximation theory, random matrix theory, algebraic graph theory, random field theory, nonparametric estimation theory, algebraic topology, differential geometry, and dynamical systems theory. Advances in these mathematical methods will then enable specific ways to model, characterize, design, and manage Air Force networks and capture and predict the performance of these networks under many diverse conditions.

Basic Research Objectives: Thus methods of consideration in network modeling might include characterizing overall network performance by finding geometric descriptions of embedded parameters of network performance, specific analytic expressions for network behavior derived...
from inverse methods on network data, and divergence analysis of parameters characterizing one state of a network from another. Characterization of network behavior might include methods classify network behavior and structure through multi-scale vector space and convexity analysis, inference and estimation of networks through algebraic, graph theoretic, and Markov random field descriptions, and understanding of the robustness of given norms and metrics in representing network behavior. Design of networks might involve understanding the efficiency, scaling behavior, and robustness of methods of information exchange including those that use both self and mutual information paradigms. Management of networks may involve assessment of stability and convergence of network protocol and policy for various network dynamical conditions with such properties as curvature, homology class, or geometric flow. Approaches should have specific applicability to Air Force communications problems but may be drawn from techniques in network analysis from a broad set of disciplines including materials science and statistical mechanics, molecular and systems biology, quantum and wave propagation physics, decision, economics, and game theory to name just a few. From this we can conceive of new directions toward a science of networked systems.

6. Information Operations and Security

Program Description: The goal of this program is to provide the science foundation to enable development of advanced cyber security methods, models, and algorithms to support future Air Force systems. Research is sought to meet the Information Operations challenges of Computer Network Defense (CND), Computer Network Attack (CNA) and the management of the cyber security enterprise.

Basic Research Objectives: The development of a Science of Cyber Security is the holy grail of this program. The development of the mathematical foundations of system software, hardware, human users and attackers, and network architectures with respect to cyber security (implemented in policy), including key metrics, abstractions, and analytical tools is a critical issue. Security policy research is of high interest to this program. Formal modeling and understanding of the human users and attackers in these systems is of high interest. Developing the understanding and tools to build inherently secure software, hardware and systems of systems and to ensure the security of the vast amounts of information flowing through relevant networks and information spaces are goals of this program. New approaches to forensics, active response, fight through and recovery from an attack on information systems, are needed. Attack attribution is of particular interest. Basic research that anticipates the nature of future information system attacks is critical to the survivability of these systems. Research that leads to methods to discover malicious code already imbedded in software or hardware is a high priority.

DSN 426-6565, FAX 703 696-7360  
E-mail: robert.herklotz@afosr.af.mil
7. Science of Information, Computation and Fusion

**Program Description:** The Air Force collects vast amounts of data through various modes at various times in order to extract and derive needed "information" from these large and heterogeneous (mixed types) data sets. Some data, such as those collected from magnetometers, register limited information content which is more identifiable at the sensor level but beyond human’s sensory reception. Other types of data, such as video cameras or text reports, possess more semantic information that is closer to human’s cognition and understanding. Nevertheless, these are instances of disparate data which encapsulate different types of "information" pertaining to, perhaps, the same event(s) captured by different modalities through sensing and collection.

The most general but relevant question is “what do these data mean?” Without a precise definition of information, it would be difficult, if not impossible, to formulate and implement abstract concepts in a consistent manner. The lack of a formal definition of information together with a supporting computational model explains why today’s technology requires a great deal of instructions from human operators. A mere definition of information without a supporting framework for computation will be of minimal value. In this case, we can only transmit or convey but cannot manipulate information. For instance, when we operate close to or at the sensor level, Shannon’s information theory has provided an unambiguous means to quantify the information capacity of a communication channel. Shannon’s theory, however, makes no reference to information content.

In view of these scientific challenges, this program seeks fundamental research with innovative approaches that can advance the forefront of the science of information. Successes in answering the questions stated below would give the Air Force capabilities to: (1) shift emphasis from sensing to information; (2) understand the underpinning of autonomy; (3) design new information systems that can cope with different data types; (4) relieve human’s cognitive overload in dealing with the data deluge problem.

**Basic Research Objectives:** A proposed technical approach towards answering the questions below should contain scientific rigor with provable properties. (1) What are the foundational building blocks or the structural components that make up “information”? (2) Is there a computational paradigm, perhaps, beyond the traditional Turing model, which can perform computation on these building blocks and what is a/the correct formulation of computational complexity in this case? (3) From these structural components, can one discover a new information theory that encompasses or generalizes the classical Information Theory à la Shannon? (4) What does fusion/integration of different information sources or data types mean, besides known examples in sensor/data fusion, database schema integration, ontology integration, compositionality of software modules, etc.? (5) Is there new mathematics that may lead to better understanding of signal, data, and information?

Dr. Tristan Nguyen, AFOSR/RSL, (703) 696-7796  
DSN 426-7796   FAX (703) 696-7360  
E-mail: tristan.nguyen@afosr.af.mil
8. Sensory Information Systems

Program Description: This program coordinates multi-disciplinary experimental research with mathematical, neuromorphic, and computational modeling to develop the basic scientific foundation to understand and emulate sensory information systems. Emphasis is on (a) acoustic information analysis, especially in relation to human auditory perception, and (b) sensory and sensorimotor systems that enable 3D airborne navigation and control of natural flight, e.g., in insects or bats, especially in relation to capabilities of autonomous biological systems not yet emulated in engineered flight.

Basic Research Objectives: One program goal is to forge new capabilities in acoustic analysis, especially to enhance the intelligibility and usefulness of acoustic information. The primary approach is to discover, develop, and test principles derived from an advanced understanding of cortical and sub-cortical processes in the auditory brain. Included are efforts to model and control effects of noise interference and reverberation, understand the psychoacoustic basis of informational masking, develop new methods for automatic speech detection, classification, and identification, and enable efficient 3D spatial segregation of multiple overlapping acoustic sources. Signal analysis methods based upon purely statistical or other conventional “blind source” approaches are not as likely to receive support as approaches based upon auditory system concepts that emphasize higher-level neural processes not yet fully exploited in engineered algorithms for acoustic information processing. Examples of such higher-level approaches recently supported are time-domain (modulation) filtering and representation, vocal tract/glottal pulse normalization, and spectro-temporal analysis based upon properties of cortical receptive fields. Although this program’s grantees have built a rich tradition of technical innovation in the acoustics area, with many important engineering applications for the Air Force, as well as for other governmental entities and the commercial sector, this program’s priority remains the advancement of the basic science that serves as a foundation for technical progress. The program is multidisciplinary, drawing upon expertise in areas such as computer and electrical engineering, neuroscience, and mathematics. Applicants are encouraged to develop collaborative relationships with scientists in the Air Force Research Laboratory (AFRL).

Another program goal is to deepen the scientific understanding of the sensory and sensorimotor processes that enable agile maneuvering and successful spatial navigation in natural flying organisms. Emphasis is on the discovery of fundamental mechanisms that could be emulated for the control of small, automated air vehicles, yet have no current analogue in engineered systems. Recent efforts have included investigations of information processing in wide field-of-view compound eye optics, receptor systems for linear and circular polarization sensing, and mathematical modeling of invertebrate sensorimotor control of path selection, obstacle avoidance and intercept/avoidance of moving targets. All of these areas link fundamental experimental science with neuromorphic or other mathematical implementations to generate and test hypotheses. Current efforts also include innovations in control science to explain and emulate complex behaviors, such as aerial foraging and swarm cohesion, as possible outcomes of simpler sensory-dominated behaviors with minimal cognitive support. As in the acoustic and
psychoacoustic areas described above, applicants are encouraged to develop collaborations with AFRL scientists. However, consistent with AFOSR’s basic science mission, all proposals to this program are evaluated for their potential transformative advance in scientific areas, not for their potential to effect technical improvements in current Air Force systems.

Dr. Willard Larkin AFOSR/RSL (703) 696-7793
DSN 426-7793 FAX (703) 696-7360
Email: willard.larkin@afosr.af.mil

9. Mathematical Modeling of Cognition and Decision

Program Description: This program supports innovative, high impact basic research on high-order cognitive processes that are responsible for human performance in complex problem solving and decision making tasks. The overall objective is to understand these processes by developing and empirically testing mathematical, statistical or computational models of human attention, memory, categorization, reasoning, problem solving, learning and motivation, and decision making. We are especially interested in how humans adapt to information-rich environments that are uncertain, dynamically changing, and often adversarial in nature, and gain knowledge and expertise to make decisions with effectiveness and efficiency; as well as how deviations of human behavior in certain situations from optimality and rational analysis can be accounted for and exploited.

Basic Research Objectives: Research to elucidate core computational algorithms such as those that pertain to understanding of the mind and brain, often posed as finding solutions to well-formulated optimization or statistical estimation problems, has proven to be particularly valuable in providing a benchmark against which human performance can be measured. Selected examples of such algorithms include (the list is not exhaustive): (1) reinforcement learning algorithms for planning and control in sequential decision making, where short and long term goals of an action are optimally balanced; (2) sequential sampling algorithms for trading between speed and accuracy in decision making under time pressure, where optimal stopping rules take into consideration payoff for a prompt but inaccurate decision and cost for delaying it; (3) classification algorithms from supervised or semi-supervised learning, where optimal generalization from examples during categorization learning is achieved through regularizing the complexity of data-fitting models; (4) hierarchical or nonparametric Bayesian algorithms for reasoning, causal inference and prediction, where prior knowledge and data/evidence are optimally combined; (5) machine learning algorithms for adaptive information sampling and design optimization.

In relating such core algorithms to human cognition and performance, research projects should not only ascertain their descriptive validity and neural plausibility or feasibility, but also deepen our understanding of mathematical characterizations of principles of adaptive intelligence cutting across spatial and temporal scales, from cellular networks to human networks. To this end, the program welcomes proposals investigating mathematical foundations of machine learning algorithms including reproducing kernels, sparse representation and compressed sensing, variational inference, manifold learning, graph diffusion, etc. The program encourages bidirectional interactions between the machine learning community and mathematics experts in
convexity/duality, functional analysis, differential manifolds, algebraic topology, and other related areas.
The program also embraces traditional approaches in mathematical psychology, for example, algebraic and measurement theoretic approaches for normative representations of belief, judgment and decision. Cross-disciplinary teams with cognitive scientists in collaboration with mathematicians, statisticians, computer scientists and engineers, operation and management science researchers, information scientists, econometricians and game theoreticians, etc., are encouraged, especially when the research pertains to common issues and when collaboration is likely to generate bidirectional benefits.

Dr. Willard Larkin AFOSR/RSL (703) 696-7793
DSN 426-7793 FAX (703) 696-7360
Email: willard.larkin@afosr.af.mil

10. Collective Behavior and Socio-Cultural Modeling

Program Description: The Collective Behavior and Socio-Cultural Modeling program is aimed to develop a basic research portfolio that will provide the empirical foundation for understanding the science cultural influence and collective violence, ultimately feeding computational models to forecast collective behavior in both virtual/non-virtual groups. This R&D portfolio specializes in basic research focused on: 1) Science of behavioral influence in different cultural groups, 2) Psychology/neurobiology of collective violence and emergent altruism, and 3) Understanding and harnessing the power of social networks/social media. The resulting portfolio directly enhances the Air Force’s impact on national security by investing in the discovery of the foundational concepts of effective deterrence, counter-terrorism and paths to violent radicalization as well as the cultivation of self-governance. The AFOSR socio-cultural R&D portfolio specifically invests in multi-disciplinary approaches combining micro-level data with econometric, neuro-metric and computational analyses. Innovative mathematics have been developed in order to gain analytical insight from incomplete, raw socio-cultural data and our social science investment has yielded a ground-breaking collection of real-world data taken from small to medium sized communities influenced and shaped by violent extremism. This portfolio seeks to provide the empirical behavioral data that can be applied to computational methods.

Basic Research Objectives: This program encourages collaboration between psychologists, anthropologists, sociologists, linguists, behavioral, cognitive, and neuro-econometric scientists as well as computational researchers in disciplines such as mathematics, computer science, and modeling. Example topics include: (1) Empirical science to reveal the culturally-specific triggers that shape behavior, trust, and attitudes (2) Self-organization, adaptation, and evolution of culturally defined entities or groups, including models of both adversarial as well as allied interactions (3) Characterization of the antecedents to collective action both altruistic and violent (4) The study of influential electronic communications/interactions and how their impact on collective behavior and attitudes.

Dr. Joseph Lyons, AFOSR/RSL (937) 255-3771
DSN 785-3771, FAX (703) 696-7360
11. Natural Materials and Systems

Program Description: The goals of this multidisciplinary program are to study, use, mimic, or alter how living systems accomplish their natural functions. Nature has used evolution to build materials and sensors that outperform current sensors (for example, a spider’s haircells can detect air flow at low levels even in a noisy background). This program not only wants to mimic existing natural sensory systems, but also add existing capabilities to these organisms for more precise control over their material production. The research will encompass four general areas: sensory mimics, natural materials, natural/synthetic interfaces, and physical mechanisms of natural systems under environmental distress.

Sensory mimetic research attempts to mimic novel sensors that organisms use in their daily lives, and to learn engineering processes and mechanisms for control of those systems. This program also focuses on natural chromophores and photoluminescent materials found in microbial and protein-based systems as well as the mimicking of sensor denial systems, such as active and passive camouflage developed in certain organisms addressing predator-prey issues.

Basic Research Objectives: The natural materials area is focused on synthesis of novel materials and nanostructures using organisms as material factories. The program also focuses on understanding the structure and properties of the synthetic materials. The use of extremophiles is added to address the development of materials not accessible due to environmental extremes. We are also interested in organisms that disrupt or deny a material's function or existence in some way.

The natural/synthetic interfaces area is focused on the fundamental science at the biotic and abiotic interface. The nanotechnology and mesotechnology sub-efforts are focused on surface structure and new architectures using nature’s idea of directed assembly at the nanoscale to mesoscale to create desired effects, such as quantum electronic or three dimensional power structures. The use of these structures is in the design of patterned and templated surfaces, new catalysts, and natural materials based-optics/electronics (biophotonics).

The "physical mechanisms of natural systems under environmental distress“ area is focused on discovering and understanding basic natural mechanisms used by organisms that could be used to either harden or repair soft material-based devices. This will enable the Air Force to employ biological systems with optimum performance and extended lifetimes. As protein and nucleic acid molecules are increasingly used as catalysts, sensors, and as materials, it will be necessary to understand how we can utilize these molecules in extreme environments, with the ability to regulate the desired function as conditions change, and to store the device for prolonged periods of time. Areas of interest include: the mechanisms for survival and protein stability in extremophilic archaea, fundamental studies of bacterial sporulation, and enzymatic engineering for faster catalysis in materials identification or degradation.

Dr. Hugh C. De Long AFOSR/RSL (703) 696-7722
DSN 426-7722 FAX (703) 696-7360
E-mail: hugh.delong@afosr.af.mil
12. Bioenergy

**Program Description:** This program aims to understand and improve the facility of photosynthetic microbes to produce biofuels (specifically, molecular hydrogen and algal lipids) for use in fuel cells and air breathing engines, and also to enhance the power density of enzymatic and microbial biofuel cells and the range of complex, impure or mixed natural substrates that the biofuel cells can oxidize and convert to electricity. The capacity to supply renewable hydrogen and high energy-dense hydrocarbons on a macro-scale using engineered photobiological systems will enable the military to power tanks, planes and ships on renewable energy, at a predictable cost basis and independent of foreign energy markets. On the other hand, microorganisms and enzymatic processes that can be bioengineered to produce electricity on a micro-scale using readily available complex or mixed biofuels could serve as portable compact power sources for such low-powered devices as remote sensors or future miniature unmanned air and land vehicles.

**Basic Research Objectives:** This program supports research that explores the biochemical and molecular processes found in certain oxygenic phototrophs, such as microalgae and cyanobacteria, which enable them to generate molecular hydrogen and lipid biofuels when supplied with only water, carbon dioxide and light. Knowledge of the physiological, biochemical and genetic factors involved in limiting and augmenting production of these biofuels will be used to bioengineer photosynthetic organisms whose generation of hydrogen and lipid biofuels will be both highly efficient and controllable. Basic research may include areas such as photosynthetic biochemistry, hydrogenase enzymology, genetic and metabolic engineering, systems biology, biocatalysis, microbial physiology and ecology, and lipid biosynthesis. In addition, some funds may be available to explore novel, fundamental biomimetic approaches in artificial photosynthesis for the generation specifically of high energy-dense solar fuels, such as straight- and branched-chain hydrocarbons. Progress in these areas is viewed as essential in developing the biotechnology needed to generate renewable, carbon-neutral supplies of lipid-derived jet fuels and fuel-cell hydrogen.

This program also supports research to enable the development of biofuel cells, both microbial and enzymatic, that can convert complex and impure fuel sources into electrical energy at sufficiently high power densities to be useful in portable devices. The idea is that biofuel cells will sustain their power by utilizing a wide range of fuel sources from the environment, such as ambient carbohydrates and macromolecules. Development of self-sustaining microbial or enzymatic biofuel cells will require understanding certain basic fundamental issues, including optimizing current production under variable conditions, biological mechanical energy storage, electron and proton transfer reactions and kinetics between enzymes/microbes and the electrode surface, theoretical modeling of mass transport in model biofuel cells, novel electrode designs, and enzyme engineering for faster catalysis.

Dr. Walter Kozumbo, AFOSR/RSL (703) 696-7720

E-mail: walter.kozumbo@afosr.af.mil
13. Foundations of Information Systems

Description: The Foundations of Information Systems program intends to foster fundamental research on new methods for analysis, management, and design of complex information systems. Traditional approaches to systems methods involve verification or equivalence model checking paradigms for software and hardware components, and are limited to analysis of individual-components in the design cycle. We seek to enable comprehensive system-level analysis, optimized performance, function, behavior, operation, fault-tolerance, robustness, adaptability and cyber-security among other properties. These approaches should be considered throughout the design, operation, and expansion of the system. Foundations of Information Systems seeks to characterize the analysis of systems in multi-scale representations of sub-components and system-layers, derived from specifications, models and measurements. Because of the heterogeneous and dynamic nature of information systems, increasing emphasis on measurement-based performance analysis is necessary to develop the capabilities sought here. Therefore, we seek methods that allow integration between specifications-based methods and measurement-based methods which involve statistical analysis and dynamical systems theory to estimate the current true state and performance of the system as a whole. Such new methods should enable quantifiable, performance-driven systems-engineering, and more powerful analysis capabilities for managing the design, operation, and scalability of systems that need to be adaptive and interoperable.

Basic Research Objectives: Fundamental strategies that integrate specification or model based methods with measurement based, statistics, risk, and dynamical system methods into a unified framework are thus of great interest. Of particular interest are multidisciplinary research efforts creating new approaches and methods that bridge across analytic, agent-based, graph-based, event-driven, and statistical Bayesian approaches, with techniques utilizing methods from model equivalency checking. Techniques in verification drawn from probabilistic process algebras, model checking, categorical logic theory, and algebraic representation theory are of interest as are methods in sparse approximation, parametric and nonparametric estimation, functional analysis, and geometric inference for system measurement and identification. Also of interest are entropy-based systems metrics, mean-field-theory, information-flow analysis and nonlinear optimization for risk assessment; operator and sheaf theoretic methods, computational homology, rigidity theory, and algebraic methods for invariant systems analysis. Any such theoretical approaches should be linked to compatible strategies which can involve techniques from systems analysis at multiple levels of abstraction, software and hardware modeling languages, software and system interfaces that improve component integration, and new methods for instrumentation and measurement. Application areas of interest, but not limited to: distributed, autonomous, and heterogeneous systems, distributed computational and cloud computing systems, information security applications, and efforts in dynamic resource management. Other related systems examples could be drawn from such diverse areas as quantum, biological, or sociological systems. These application areas should have relevancy to current Air Force needs.

Dr. Robert Bonneau AFOSR/RSL (703) 696-9545
DSN 426-9545 FAX (703) 696-7360
Email: robert.bonneau@afosr.af.mil
14. Robust Computational Intelligence

Description: This program supports basic research in computational intelligence necessary to create increasingly robust problem-solving systems. Robustness is defined as the ability to achieve high performance given at least some or all of the following factors: uncertainty, incompleteness or errors in knowledge; limitations on sensing; real-world complexity and dynamic change; adversarial factors; unexpected events including system faults; and out-of-scope requirements on system behavior. The program seeks research proposals to investigate fundamental principles, methodologies, and architectures that will enable computational systems to achieve high performance, adaptation, flexibility, self-repair, and other forms of intelligent behavior in the complex, uncertain, hostile, and highly dynamic environments faced by the Air Force. The vision of this program is that future computational intelligence systems will act as human intelligence amplifiers in such areas as planning, sensing, situation assessment and projection; will monitor, diagnose, and control aircraft or spacecraft; and will directly interact with humans and the physical world through robotic devices. Therefore, research that enables mixed-initiative interaction and teaming between autonomous systems and human individuals or teams is an important part of the program. The program encourages research on computational architectures that derive from and/or integrate computational, cognitive, and biological models of intelligence. Research of computational architectures that lead towards integration of human and machine intelligence are also of interest. Proposals to investigate the basic principles of computational intelligence for memory, reasoning, learning, action, and communication are desired insofar as these contribute directly towards robustness as defined above. Research proposals on computational reasoning methodologies of any type and combination, including algorithmic, heuristic, or evolutionary, are encouraged as long as the proof of success is the ability to act autonomously or in concert with human teammates to achieve robustness as defined above.

Basic Research Objectives: The preferred methodology of this program is experimental, where theory is tested against real-world (or realistic) data sets and with the use of physical devices (including robots) as experimental apparatus where appropriate. The program encourages multidisciplinary research teams, international collaborations, and multi-agency partnerships. This program is aggressive, accepts risk, and seeks to be a pathfinder for Air Force research in this area. Proposals that may lead to breakthroughs or highly disruptive results are especially encouraged.

Dr. Willard Larkin AFOSR/RSL (703) 696-7793
DSN 426-7793 FAX (703) 696-7360
Email: willard.larkin@afosr.af.mil
**Discovery Challenge Thrusts (DCTs)**

This section outlines cross-cutting multi-disciplinary topics that support the AFOSR’s Discovery Challenge Thrusts (DCTs). Research efforts will consist of interdisciplinary teams of researchers with the skills needed to address the relevant research challenges necessary to meet the program goals. Proposers are highly encouraged to confer with the appropriate AFOSR program manager. White Papers briefly summarizing your ideas and why they are different from what others are doing are highly encouraged, but not required. Coordination with the Air Force Research Laboratory is also encouraged but not required.

Air Force program managers are listed by Sub areas below.

1. **Integrated Multi-modal Sensing, Processing, and Exploitation**

**Description:** The Air Force Office of Scientific Research is seeking basic research proposals to conceive adaptive multi-modal EO-RF sensor concepts in a ‘performance-driven’ context that addresses the challenging problems of detecting, tracking, and identifying targets in highly cluttered, dynamic scenes. ‘Performance-driven’ requires that the development of novel adaptive multi-modal sensing hardware concepts be closely coupled with concurrent developments in novel physics-based modeling and simulation of target scene phenomenology, environmental interactions, and breakthroughs in data processing and exploitation. An integrated approach allows for assessing the utility of combining different sensing modalities, utilizing associated novel fused-data processing schemes for the target and background scenes of interest. It is expected that each research effort will consist of an interdisciplinary team having the appropriate skills needed to address all of the relevant program research challenges.

**Background:** The premise of this research is that developing adaptive multi-modal sensors able to capture multiple electromagnetic observables (intensity, wavelength, polarization, and/or phase) in a time-resolved, ‘staring’ imaging format will provide dramatically enhanced detection and identification capability for extremely challenging military problems involving low contrast targets over broad areas in a highly dynamic scene. Battlefield sensing requirements include finding and tracking individuals of interest in populated urban areas, detecting activity and materials indicative of IED placement, and detecting and identifying threatening space objects at long ranges. Historically, military target recognition involved conventional military objects exhibiting unique spatial and spectral signatures that were generally isolated from densely populated areas. However, today’s target recognition problems include discriminating a multitude of complex objects deeply embedded in urban areas, day and night, where the most common urban objects can have tactical significance, and achieving high detection probability is critical to mission success. Current-generation remote sensing methods (e.g., broadband FLIR) are limited in their ability to search and detect camouflaged targets in deeply-hidden or highly-cluttered backgrounds. Proven approaches for enhancing
deeply-hidden, high-clutter target recognition includes utilizing multi- to hyper-spectral exploitation to improve signal-to-clutter ratio, and fusing multi-modal/multi-discriminant data, such as FLIR with SAR, to significantly reduce the amount of processing required for target classification, while simultaneously increasing target ID confidence.

However, limitations facing state-of-the-art multi- and hyper-spectral imagers include their ‘step-stare’ mode of operation (vs. desired staring mode) with revisit times that compromise detection of rapid moving targets, and their fixed-multi/hyper-band construct that can result in a tremendous amount of unimportant data for exploitation. Also, today’s airborne hyper-spectral sensors are massive, typically 4-5X that of typical FLIR sensor units employed on tactical aircraft and weapons platforms, and they also require greater sensitivity than typical FLIR sensors to overcome the reduced photon count in narrow wavelength bands. Challenges confronting fusion of multi-discriminant data from single-mode detectors include handling translational registration errors, and a lack of robust, efficient feature extraction and correlation capabilities. To avoid the problems of unnecessary or unproductive sensor use and computations, it would be desirable to ‘intelligently’ select ‘on-the-fly’ an optimum subset of sensors and sensor settings that are most decision-relevant. While this will be very difficult, requiring breakthroughs in many sensing technology fronts, emerging innovations in semiconductor materials, device structures, and information sciences offer many interesting opportunities. A ‘home-run’ approach of interest is to innovate and develop a tunable multi-mode, vertically-integrated (common sensor package), large-format staring focal plane array to accommodate the dynamic sensing requirements dictated by the dynamic target scene. This would involve actively controlling sensor modes and settings to optimize information gathering in a knowledge-based manner with an identifiable selection criterion.

**Basic Research Objectives:** Program focus is on modeling and simulation of novel concepts for high-performance tunable multi-modal EO-RF focal plane arrays. This includes innovative physical device concepts and prediction of single- and fused-mode detector output signals, in coordination with first-order benefits analysis modeling of downstream data exploitation. Novel multi-modal detector designs should be guided by consideration of how they can optimally exploit the phenomenology of multi-modal target scene signatures; and of how multi-mode data streams can be fused and interpreted in novel and beneficial ways. For example, fused spectral-polarimetric signatures provide information on target material composition, surface characteristics, and 3-D shape simultaneously from a single sensor snapshot, where information in the spectral dependence on polarization state may not be evident from separated polarization and spectral data. To exploit these and other multi-mode opportunities, a closely coordinated multi-discipline research team, expert in detector device design, data fusion, and image processing and exploitation will be needed. While the primary focus of basic research is on innovative integrated multi-modal EO-RF detector device concepts, supportive analysis and understanding of downstream data exploitation utility will
be essential. Sensing modalities of interest include spatial, spectral, polarimetric, radiometric, and temporal; wavelengths of interest span UV (0.2um) to RF (mm). The envisioned multi-modal device design should build from extensive developments in both passive and active sensing, but specifically address the basic research aspect of multi-modal integration into a common sensor package (e.g., detector array). The ultimate vision would be a starring sensor development approach that optimizes the collection of phenomena to support detection, tracking, and identification functionality. The sensor would capture, at the pixel level, the right combination of the pixel intensity spectrum, polarization state, time evolution (at high enough bandwidth to capture active ranging and vibration information), and possibly phase (field vs. intensity), and work cooperatively with other sensors to perform such functions. This sensor would be accompanied by a high fidelity model to confidently predict its performance as a function of sensor configuration and target and background characteristics. It is expected that proposals will describe cutting-edge efforts on basic scientific problems.

**Program Scope:** Single awards will typically be $250-300K per year, for 3 years. It is expected that each research effort will consist of an interdisciplinary team with the skills needed to address all of the relevant research challenges necessary to meet the program goals. Multi-university teaming is encouraged.

Dr. Tristan Nguyen/AFOSR/RSL (703) 696-7796
FAX (703) 696-7360
E-mail: tristan.nguyen@afosr.af.mil

**2. Robust Decision Making**

**Description:** The need for mixed human-machine decision making appears at all levels of Air Force operations and pervades every stage of Air Force missions. However, new theoretical and empirical guidance is needed to prescribe maximally effective mixtures of human and machine decision making in environments that are becoming increasingly complex and demanding as a result of the high uncertainty, complexity, time urgency, and rapidly changing nature of military missions. Massive amounts of relevant data are now available from powerful sensing systems to inform these decisions; however, the task of quickly extracting knowledge to guide human actions from an overwhelming flow of information is daunting. Basic research is needed to produce cognitive systems that are capable of communicating with humans in a natural manner that builds trust, are proficient at condensing intensive streams of sensory data into useful conceptual information in an efficient, real-time manner, and are competent at making rapid, adaptive, and robust prescriptions for prediction, inference, decision, and planning. New computational and mathematical principles of cognition are needed to form a symbiosis between human and machine systems, which coordinates and allocates responsibility between these entities in an optimal
collaborative manner, achieving comprehensive situation awareness and anticipatory command and control.

**Basic Research Objectives:** In the area of a) data collection, processing, and exploitation technologies, there is a need for (a.1) attention systems for optimally allocating sensor resources depending on current state of knowledge, (a.2) reasoning systems for fusing information and building actionable knowledge out of raw sensory data, (a.3) inference systems for real time accumulation of evidence from conflicting sources of information for recognition and identification. In the area of b) command and control technologies, there is a need for (b.1) prediction systems for anticipating future behavior of adversarial agents based on past experience and current conditions, (b.2) rapid decision systems with flexible mixtures of man and machine responsibilities for reactive decision making under high time pressure, (b.3) robust strategic planning systems designed to allow for sudden changes in mission objectives, unexpected changes in environment, and possible irrational actions by adversaries. In the area of c) situation awareness technologies, there is a need for a human-system interface that (c.1) faithfully simulates the content of a human operator’s working memory buffer and its update thus modeling the operator’s dynamic awareness of inputs, constraints, goals, and problems, (c.2) optimizes information delivery, routing, refreshing, retrieval, and clearance to/from the human operator’s awareness while utilizing the latter’s long-term store for expert knowledge, memory and skills for robust decision making, (c.3) achieves symbiosis between human and machine systems in delegating and coordinating responsibilities for command and control decisions. In sum, new empirical and theoretical research is needed that provides a deeper understanding of the cognitive requirements for command and control by a decision maker with enhanced capability for situation awareness, allows for greater degree of uncertainty in terms of reasoning systems, produces greater robustness and adaptability in planning algorithms in dealing with unexpected interruptions and rapidly changing objectives, generates greater flexibility in terms of assumptions about adversarial agents, and gives clearer guidance for dealing with the complexities encountered in network-centric decision tasks. Projects that bridge the conceptual gaps between state-of-the-art statistical/machine learning algorithms or AI systems and human cognition and performance are particularly welcomed.

**Program Scope:** Typical awards could be $100-200K/year. It is expected that each research effort will consist of an interdisciplinary team formed from some combination of cognitive, computer, engineering, and mathematical/statistical scientists having the appropriate skills needed to forge new breakthroughs and make significant fundamental progress in this area.

FAX 703 696-7360
E-mail: willard.larkin@afosr.af.mil
3. Turbulence Control and Implications

**Description & Background:** Under the AFOSR Discovery Challenge Thrust: Turbulence Control and Implications, AFOSR is pleased to solicit basic research proposals addressing the exploration, characterization, and modeling of fundamental processes in transitional and turbulent flows including, but not limited to, flow regimes characterized by either low Reynolds number or compressibility. Specific topics of interest for this BAA include the following.

**Basic Research Objectives:**
Effective actuation in flowfields relevant to AF systems that exploits flow physics (flowfield bifurcations, instabilities, etc.) and responds to a dynamic environment, with the following qualities:

- Robust, scalable actuation with adjustable authority as required by flow conditions. Both passive and active approaches may be considered.
- Characterization of the effectiveness of flow control methods, considering the influence of actuation rate and phase with respect to flow structures for tailored amplification or attenuation of disturbances.
- Development of robust, reliable sensors for flow control. Desired sensors should be adaptive, embeddable in the system, and possibly self-powered. Sensors should measure surface shear stress, pressure, or another physical quantity useful for inferring the flow state. Ideal sensors will be sensitive to very-low-amplitude disturbances with high spatial- and temporal-resolution and signal-to-noise ratio. Integration into limited-size wind-tunnel and flight experiments also must be considered.

High-fidelity models of transitional and turbulent flows incorporating flow control: Models should enable characterization and reliable prediction of physical phenomena associated with flow control, including transient and dynamic processes. Additionally, the models developed under this thrust should enable the development of reduced-order models for complete potentially-fielded flow control methods to facilitate design requirements and optimization without compromising other mission aspects. Research areas of interest under this topic include, but are not limited to, the following:

- Incorporation of multi-disciplinary analysis (e.g., aerodynamics, structures, materials, controls, sensing and actuation) including transfer of the proper physical quantities between sub-models for various disciplines.
- Integration of experimental, numerical and theoretical analyses.
- Development of advanced diagnostics required for characterization of the fundamental phenomena associated with flow control methodologies and for validation of numerical simulation tools.

Ideally, basic research efforts supported under this BAA will have relevance to a wide variety of potential applications. Air Force interest in the research solicited under this portion of the BAA includes, but is not limited to, potential application to the following flows:
• Compressible flow at high-subsonic, transonic or low-supersonic conditions for flight vehicles intended to efficiently operate across several speed regimes.
• Low-Reynolds number unsteady flows encountered by agile micro air vehicles.
• Transonic compressible flow over aero-optic turrets and cavities.
• Unsteady flows generated by high-lift systems, propulsion systems and landing gear responsible for significant acoustic emissions.

**Program Scope:** Both single- and multi-investigator proposals will be considered, with typical awards in the range of $100k-$300k.

Dr. John Schmisseur/AFOSR/RSA (703) 696-6962
FAX (703) 696-8451
E-mail: john.schmisseur@afosraf.mil

4. Space Situational Awareness

**Description:** The Air Force Office of Scientific Research is seeking basic research proposals to develop concepts and capabilities in the area of Space Situational Awareness (SSA). The goal is to detect, track, identify, and predict future capabilities, actions, and positions of all space objects at all altitudes with known accuracy and precision. This capability must include on-demand capacity for a highly-detailed characterization of individual space objects. SSA is more than the observation of the location and orbit of an object in space or the image of the object; it must include the ability to identify a satellite’s capabilities and predict future operations and performance limits with known confidence. Therefore, we must be able to detect and understand the configuration and orientation of the satellite, and to detect and quantify maneuvers through changes in orbital state, object signature or telemetry, or characteristics of exhaust products. Prediction of the precise location of satellites and limitations to satellite operations requires knowledge of the space environment in near-real time and an understanding of the impacts of the space environment on space systems. Understanding of the physics of the environment is also required for accurate space environment forecast models.

**Background:** The challenge of SSA is to rapidly and accurately locate and comprehensively characterize every object in space with known confidence and in near real time, including its orbital parameters, physical state, purpose, and capabilities, to anticipate future actions based on real-time estimates of changes in state using all sources of possible information, and to appropriately and rapidly provide actionable, useful information. Predictive SSA helps to ensure the safe flight of satellites and to mitigate impacts from the space environment on operations. It provides the capability to identify, characterize and monitor all potential threats to friendly space assets and adversary space capabilities that pose a threat to friendly terrestrial forces and to make after-action assessments.
SSA is long-term, immense in scope, continual in maintenance, and demanding in detail and timeliness.

Our space surveillance models, tools and sensors today have significant capabilities but are not adequate for the problems of the future. Space search and track requires observations over several orbits and may take from days to months for the identification of small and poorly resolved objects. In addition, data are limited by collection methods to specific orbital planes and local times for space-based observations and to specific locations for ground-based observations. Observations of small and distant satellites are especially problematic, as is the discrimination of these objects from space debris.

Knowledge of the space environment is an integral part of SSA. This knowledge is based on theoretical studies of a sparse data set of ground- and space-based remotely sensed data and \textit{in situ} observations. Each observational modality has fundamental limits. Current models provide some capability of "nowcasting," but are limited by deficiencies in the physical understanding of the solar-terrestrial system. Much of the current forecasting capability is based on statistical or climatological models.

\textbf{Basic Research Objectives:} Successful proposals will propose research that addresses the current needs for space situational awareness described above. Priority will be given to proposals that address basic principles and fundamental limits of the following:

1. Non-imaging techniques leading to the identification and characterization of un-resolved space objects.
2. Innovative solutions to the inverse problems associated with characterization of non-resolved space objects.
3. Novel imaging or image processing methods to fundamentally decrease limitations on remote imaging of space objects
4. Predictive analyses of space objects that include characterizing, tracking and predicting the behavior of individual and groups of satellites using multi-source data.
5. The resolution of uncorrelated tracks and marginally detectable targets using sparse data.
6. The physical processes that control the formation and growth of ionospheric irregularities that impact communication, navigation and radar systems.
7. Phenomenology and basic physical processes leading to the understanding and forecasting of the neutral atmosphere and ionosphere.

\textbf{Program Scope:} The typical awards will be $150-250K per year for a three-year effort. Although it is expected that single investigator projects will be awarded, multidisciplinary team proposals will also be considered. Collaboration with researchers at the Air Force Research Laboratory is encouraged.

Dr. Kent Miller/AFOSR/RSE 703-696-8573
FAX 703 696-8481
5. Complex Networked Systems

Description: Air Force network systems today are faced with increasing demands on reliability and performance in many heterogeneous mission scenarios, network infrastructures, policies, and protocols. In order to address these challenges, we wish quantify the likelihood that critical information associated with specific mission needs will reach its destination with predictable latency rather than packets simply reaching their destination. Additionally, we would like to quantify the likelihood that a given network protocol or policy will support delivery of this information with a certain probability. We would also like to ensure that such policies will not lead to network instability due to lack of resources or introduce vulnerabilities in security. Finally, we would like to establish a comprehensive strategy to manage network content, protocol, policy, and network structure for highly heterogeneous and dynamic network conditions. Examples of such strategies may involve in distributed network coding, estimation, optimization, and routing techniques, that can recover and route information even if protocols fail or are interrupted. Additionally they include network analysis techniques that can detect or inference global network performance from many sparse distributed local measurements. These fundamental approaches to assessment and design of information exchange will then be used to improve overall network protocol performance, detection of and resilience to attack, scalability, routing performance, human network interaction, coding efficiency, resource utilization, throughput, latency, and reconfigureability as examples.

Basic Research Objectives: We thus wish to establish new methods to design and manage networks that assess and quantify performance at all levels and conditions of network operation. Areas of interest in ensuring predictable network performance include new methods for coding and quantization, new approaches for advanced rate distortion analysis, entropy, and error correction coding. We would also like a mathematical means of guaranteeing system performance in the context of dynamic network policies, human network interaction and decision-making, heterogeneous wired, wireless, and hybrid networks, and scalable numbers of users. We would like to explore methods of assessing the relative effect and interaction of different layered mission functions on a network including reconnaissance, distributed computation, platform positioning and control, and overall course of action prediction. At the networking level, areas of interest include new approaches to assessing the reliability of connections as a result of current and future protocol layering and buffering and cashing approaches, data retransmission, flooding, and latency. We would also like to develop new mathematical paradigms for quantifying centralized and decentralized routing performance and multiple access. In the area of physical transfer of data, we would like to understand new approaches to predictable space time coding,
modulation, spectrum access, and physical routing mechanisms that are resilient to interference and attack.

**Program Scope:** Typical awards could be $125-250K per year for individual investigators. Multidisciplinary team proposals also are encouraged and will be considered on a case by case basis. Projects that include collaboration with scientists in the Air Force Research Laboratory are encouraged.

Dr. Robert Bonneau/AFOSR/RSL 703-696-9545
FAX 703 696-7360
E-mail: robert.bonneau@afosr.af.mil

6. Reconfigurable Materials for Cellular Electronic and Photonic Systems

**Background:** Background: In microelectronics, reconfigurable cellular electronic and photonic arrays (RCEPAs) have great potential of directly implementing complex systems as software-defined emulations, configuring pre-built (but uncommitted) logic, interconnect, switching, memory and other resources to perform a desired set of functions. The success in design, utility, and implementation of RCEPA systems is tightly coupled to the materials and geometries used in these basic device cells, as well as the choice of layout and interconnect of such device elements to serve as a switch array. Since these systems initially will be generic and be subsequently personalized for specific scenarios, operational emulations and functional personalization can be rendered quickly into useful systems, much faster than creating an equivalent custom integrated circuit. Architectures in hardware can now be software-defined. RCEPAs are malleable and, conceptually, infinitely reformable. Besides providing flexibility, reconfigurability also can provide resilience despite thousands of latent material and device point defects or faults, because the emulations are, in general, non-unique, so that circumlocution is possible. The impressive scale of integration in modern functional switching array systems with over $10^6$ gates can lead to their displacing custom integrated circuits in many applications, depending on the physical technology being used to implement such a system.

Although such system implementations, such as field programmable gate arrays (FPGAs) which manipulate discrete, binary information are currently available, little work has been done to create architectures that exploit other forms of materials reconfiguration. A diversity of new concepts has emerged in reconfigurable materials, devices, circuits, and more elaborate forms of nano/micro-structural elements. These include phase-change, ferroic, magnetoresistive materials and devices, and micro- and nano-microelectro(opto)-mechanical (NEM/MEM/NOEM/MOEM) structures. These reconfigurable materials, devices, and structures generate a variety of interesting multi-state/continuum behaviors. Computational paradigms could be hybridized in principle and thereby be extended in performance. One can consider the in situ manipulation of electron,
photon, phonon, magnon, magnetic domain, exciton, fluidic transport, modulation of aerodynamic surfaces, programmable attachment and assembly of components, and generation and reformation of wiring systems. New strategies can be studied and leveraged to exploit these alternate reconfigurability modalities in new types of architectures. In addition to investigating a “bottom-up” strategy based on material phenomenon physical change mechanisms, a simultaneous “top-down” research strategy is possible based on architectures and languages. These latter strategies can also provide logical starting points for new classes of reconfigurable systems that are inspired through cellular arrangements of primitive building blocks.

**Objective:** Identify and better understand new reconfigurable materials, switching device concepts, and the viability of developing RCEPA architectures, languages, and synthesis tools based on cellular arrangements of primitive building blocks. These building blocks can be MEMS-like, MOSFET-like, phase change materials-like, magnetic-domain-like, photon transmissive-like, spintronic-like, or any mechanism that enables an externally digitally controlled, rapidly-reversible change between two or more (up to continuum) well-defined states in a way that allows for a redundant easily programmable system.

Research Concentration Areas: Research proposals are expected to address ideas from reconfigurable phenomenologies that motivate systems-level concepts, suggesting a multi-disciplinary teaming approach. This work focuses on integrating reconfigurable device concepts into flexible, multi-functional configurations designed to operate in simple to program architectures. Research areas include but are not limited to:

- Identification, characterization, and optimization of new primitive reconfigurability mechanisms in materials and nano/micro-scale structures (e.g., NEMS/MEMS or photonic approaches).
- New concepts for devices, materials, and mechanisms that lend themselves to high performance and highly efficient RCEPA organization. Particular emphasis should be placed on prospective architectures that involve photonic write/electronic read, electronic write/photonic read, or photonic write/photonic read systems. **Improvements of existing and about-to-be introduced commercial and conceptual electronic write/electronic read approaches are not being solicited.**
- Extension of cellular networks with scale-free, random/amorphous (or other) network models to effectively harness the associated phenomenologies.
- Development of an understanding of the suitability of (homogeneous or heterogeneous) cellularity (two- and/or three-dimensional) as a theme for new configurations that aggregate these primitive cells;
- Development of suitable complementary concepts for expressive capacity, language constructs, metrics, and synthesis heuristics needed to mobilize large multi-dimensional ensembles of primitive cellular (or alternatively ordered) arrangements.
Interest domains include the emulation and interconnection of the following elements: (1) digital, (2) analog, (3) power, (4) microwave, (5) optical, (6) other sensing/actuation concepts, and mixtures of these domains. Impact: New classes of reconfigurable electronics and photonics are expected to result in revolutionary expressions of pervasive morphability in warfighting systems. This morphability can lead to greater flexibility (and in some cases performance), resilience, and the ability to form systems more rapidly.

Program Scope: Typical awards will be in the range of $150K–$250K each year for three years. Collaborative projects which involve interaction between principal investigators at federally supported laboratories, such as AFRL, and/or FFRDCs coupled with an academic researcher will be considered. In this instance, a single joint proposal is appropriate, jointly vetted and supported by the management of the participating institutions. Interested parties should contact the topic research chief before submitting a brief “white paper.” Formal proposals should be prepared only by invitation.

Dr Gernot Pomrenke/AFOSR/RSE  (703) 696-8426
FAX (703) 696-8481
E-mail: gernot.pomrenke@afosr.af.mil

7. Thermal Transport Phenomena and Scaling Laws

Description & Background: Discover new techniques for modeling, analyzing, and understanding thermal phenomena at multiple time and length scales in emerging and novel material systems, and exploiting these phenomena to design future materials and components with improved thermal transport properties (conduction, convection, and radiation). Improved thermal transport is vital to enable in future structural and electrical components the ability to operate at elevated performance levels while maintaining adequate reliability and lifetime.

Of special interest is investigating the potential for tailoring thermal transport properties utilizing breakthroughs in nano materials, structures, and devices. The end goal is to greatly improve our understanding of the thermal transport phenomena in bulk materials and heterogeneous material interfaces that are essential to help enable the future high temperature needs of critically enabling military technologies, such as high-speed processing & high power electronics and hypersonic thermal protection and propulsion systems. In particular, proposals in the following subject areas are encouraged:

Basic Research Objectives:
New materials (multi-phase and/or heterogeneous structures) that provide a wider spectrum of thermal conductivity and insulation, thermal capability -- possible areas of emphasis:
- Tuneable (dynamic) thermal conductivities of materials
• Biomimetic approaches

Multi-scale characterization and modeling tools – possible areas of emphasis:

• Tools to address complex coupled multiple physics phenomena (e.g. thermal, mechanical, magnetic, electric, etc)

• Robust models with increased fidelity and speed

Program Scope: Typical awards will be $125-250K. It is expected that single investigator projects will be awarded. Collaboration with researchers at the Air Force Research Laboratory are encouraged but not required. White papers are required and should be no more than 2 pages in length. White papers should be sent by email and must include a short project description, discussion of how the proposed research will advance fundamental scientific understanding and a proposed budget for 3-5 years. Successful whitepapers will be invited to submit full proposals.

Dr. Kumar Jata AFOSR/RSA

Email: kumar.jata@afosr.af.mil

8. Radiant Energy Delivery and Materials Interaction

Goal: Understand and control the generation, propagation (particularly through complex media), scattering, and deposition of radiant energy at all wavelengths, intensities, and timescales. Explore the possibility that various natural media (dispersive, turbulent, random, etc) sustain certain EM waveforms more effectively than others as a result of their internal structure, geometric effects, and spatially heterogeneous dielectric and magnetic properties. Explore various manmade media (photonic bandgap materials, negative index materials, etc) for effects such as unidirectional propagation or total field trapping which might revolutionize the design/performance of a host of devices (antennas, baluns, delay lines, etc).

Science: Electromagnetic characterization (dispersion relation, index of refraction, etc) of complex media, both natural and manmade, needs to be pursued. For example, little is known concerning propagation events when the media has “fluctuations” resulting in fast temporal and/or spatial variation of the index of refraction. Examples include: turbulent media (atmospheres and boundary layers around fuselages), rustling foliage, clouds (due to Brownian motion of the water droplets), and urban environments (where multipath propagation limits communications and radar operation).

An example question is: “What is the detailed temporal and spatial statistical structure of the Doppler shift, if any, from fluctuating media?” It is anticipated that fluctuations, such as those occurring in clouds or the ionosphere, produce
dephasing of transmitted signals/waveforms (resulting in such degradation as to prohibit imaging) as well as other unwanted artifacts and attempts at ameliorization are best served by fundamental understanding of the phenomena.

The above discussion leads in turn to the basic research challenge of identifying possible medium and target specific “optimal” waveforms (likely not CW if spatial resolution, provided by sufficient bandwidth, is the figure of merit) as well as spatial aperture distributions. The issue of optimal waveforms is a new time-domain direction for theorists studying Maxwell’s equations and is currently exemplified by waveforms called precursors which appear to be optimal for a large class of notional dispersive media (Debye, Lorenz, and Rocard-Powles).

Provide the underlying theory leading to the design of transceivers which can emit the above waveforms and identify the accompanying software paradigms which can intelligently deal with the non-CW nature of the returns. Also provide the underlying theory, which is anticipated to include a deeper understanding of various manmade media (such as photonic bandgap media and negative index media), leading to the design of electrically small antennas (on possibly exotic/complex substrates) having such attractive attributes as being highly directional, and having wide bandwidth. For example, there is no predictive method to anticipate a material’s relationship between energy stored coherently and energy lost as heat. Construction of a microscopic theory would permit accelerated material design. Questions regarding conformal phased arrays (also on possibly exotic/complex substrates) include whether there is a fundamental relation between the minimum profile of such an array and its bandwidth or scan range. In addition, impedance matching from the signal source to the antenna is especially difficult in the wideband case. Developments made in antenna theory must be complemented with developments addressing impedance matching and improved design of baluns.

Pursue a deeper and more comprehensive understanding of ultrashort, high peak intensity laser pulses. Issues such as nonlinear propagation through the atmosphere (as well as through such obscurants as clouds) together with the novel nature of the light/matter interaction of such pulses (also important in materials processing scenarios) should be considered. Specific issues that merit basic research attention include filamentation control, energy deposition range control, propagation distance enhancement, ancillary production of THz radiation, and generation of plasma discharges in the atmosphere.

Carefully interrogate the Maxwell Semiconductor Bloch description of solid state lasers in order to lay the groundwork for the design/operation of coupled SSLs which could, when their individual chaotic outputs are suitably orchestrated and the thermal loads are suitably ameliorated, provide effective HEL performance. Other results flowing from basic research in MSB include novel THz production from semiconductors.

Dr. Arje Nachman AFOSR/RSE (703) 696-8427
9. Socio-Cultural Modeling of Effective Influence

**Background:** The Air Force has recognized cyberspace as a war-fighting domain, but it is not independent of the physical domains of air and space. It can be observed that non-kinetic information operations can influence the actions of people and technology in air and space. Likewise, kinetic operations in air and space can have observable effects in cyberspace and in the ways in which individuals and groups react. In a flat interconnected world, it is important to understand the causal relationships between actions and observations that cross the boundaries of the air, space, and cyberspace domains. The Air Force is interested in modeling and analysis of the chains of causality, both immediate and long-term, that relate phenomena across these spaces. Because these phenomena include human behavior, areas of interest include the modeling of effects of cultural variables in groups and communities to situations that might occur in military and related situations. Such situations might include weapons effects, the behavior of individuals and groups to non-lethal weapons, culturally conditioned responses to natural cataclysmic events and other disasters, cyber-related effects, etc.

**Basic Research Objectives:** We are interested in developing a basic research foundation for incorporating an understanding of factors underlying socio-cultural/population variability into effects based operations suitable for application in a variety of domains. Areas of interest include the modeling of the effects of population variables in groups and communities to situations that might occur in military and related situations. Such situations might include weapons effects, the behavior of individuals and groups, including friendly forces and populations, to non-lethal weapons, culturally conditioned responses to natural cataclysmic events and other disasters, cyber-related effects, etc.

Such problems can be characterized by high dimensionality and parallel causation. Effects may also be characterized by varying time courses and latency over a long period of time. Actions in one domain may have 2nd order effects in the same or in another domain such as the population effects of cyber initiatives. The predominant importance of 2nd order effects in the cyber domain (such as in an info warfare campaign) is an interesting aspect. Can we parameterize socio-cultural models in virtual environments? What are the basic computational and/or modeling tools to study such effects in the domain of human group behavior?

We are interested in group and inter-group behavior modeling – that is the culturally determined behavior of large groups and communities over time. We are most interested in how to identify and quantify cultural variability in ways that allow their incorporation into such models. Applications include understanding community (both physical and virtual) decision making and control. If you are
comparing a crowd's/group's/community's response to the expected response, how are you measuring their response? Secondary effects such as community reaction, etc. might result from a variety of weapons types, both lethal and non-lethal, physical and cyber.

We encourage proposals addressing new mathematical tools for socio-cultural modeling including approaches that integrate normative (rational), prescriptive, and descriptive approaches, counterfactual reasoning, reasoning about unknown tasks, bargaining, bluffing, framing, etc.

Conditioning and context/situation are also relevant - the behavior of a given population to a stimulus given in one situation might be different than the response to the same stimulus in other situations. Priming can cue a particular behavioral output. Non-traditional marketing approaches including internet and multi-cultural approaches are applicable to influencing individuals, groups and communities.

Often the only data available are observational making causal inference problematic. What are the things to be measured and how do we measure them? Does it have to be interviews on the ground? What are the observables today, what do they need to be in ten years? What implications does this type of data have for modeling efforts – data driven modeling? How should data be collected so that it is usable be modelers – model driven data collection? Innovative approaches to data collection and analysis in this domain are needed such as adaptation of anthropology, bioinformatics, computer science, dynamic systems, economics, epidemiology, international relations, marketing, mathematics, psychology, political science, sociology, operations research, etc.

Basic research methodologies and metrics are needed to study such multi-parameter group behavior problems characterized by sparse and uncertain data, multi-causality and second order effects. We are also interested in overall assessment of models including issues such as meta-modeling, validation, verification, generalizability/transportability, sensitivity analysis, currency, etc. Innovative computationally-based and multi-disciplinary approaches to ill-posed problems involving multiple parameters are encouraged.

**Program Scope:** Typical awards will be single investigator grants of three-year duration. But proposals involving an interdisciplinary team with the skills needed to address all the relevant research challenges necessary to meet the program goals will also be considered. Collaboration with scientists in the Air Force Research Laboratory (AFRL) is encouraged, but not required. White papers are encouraged as an initial and valuable step prior to proposal development. The white papers that are found of interest will be encouraged to develop into full proposals.

Dr. Terence Lyons AFOSR/RSL (703) 696-9542  
DSN 426-9542 FAX (703) 696-7360  
E-mail: terrence.lyons@afosr.af.mil
10. Super-Configurable Multifunctional Structures

**Background:** The demands of real-time performance optimization for reconfigured missions require a variety of aerospace platforms to obtain the capability of dramatically altering their shape, functionality or mechanical properties in response to the changes in surrounding environments or operating conditions. The most well-known example of this concept is “morphing” aircraft that can change their wing shape and thereby perform flight control without the use of conventional control surfaces or seams similar to what is found in nature. Morphing wing aircraft promises the distinct advantages of being able to fly multiple types of missions, to perform radically new maneuvers impossible with conventional control surfaces, and to provide a reduced radar signature. By extending the concept beyond the case of shape change in morphing wing aircraft, more complex forms of reconfigurable systems can be envisioned involving combined changes of shape, functionality and mechanical properties on demand such as utilized in bats, but on a more extreme scale. Examples of such reconfigurable multifunctional structures, referred hereafter as “super-configurable” structures, include: (a) morphing unmanned aerial vehicles (UAV) that are capable of efficiently loitering in a region for surveillance and then reconfiguring for a high-speed dash to engagement, and would require full integration of sensing, communication, actuation and propulsion capabilities into load-bearing structures for higher system efficiency, and (b) space-deployable systems enabling a notional asset delivered in compact form in the upper atmosphere and under extremely harsh loading conditions (such as Mach 6) and subsequently reconfigured to produce a multiple number of micro-UAV’s with sub-meter dimensions for surveillance operation in the lower atmosphere.

From current trends in the research area of morphing wing aircraft, it is evident that the practical realization of morphing structures is a particularly demanding goal with substantial research effort still required. This is primarily due to the need of any proposed structures to possess conflicting abilities to be both structurally compliant to allow configuration changes but also be sufficiently rigid to limit the aero-elastic divergence. On top of these requirements, the design of the morphing structures must take full account of the weight penalty and the power requirements for the control mechanisms to ensure an overall performance benefit. Complexity of the problems and conflicting requirements are expected to be even greater for the proposed super-configurable multifunctional structures involving combined changes of shape, functionality and mechanical properties. The design of these multifunctional structures depends on the mode of reconfiguration, the specific materials and geometries employed, the attachment mechanism between elements, and the location of the actuating elements. A diversity of new concepts has emerged not only in reconfiguration of structures, but also in adaptive materials or materials systems, sensors, actuators, signal transmitters, energy transduction mechanisms to power the reconfiguration process and etc. When these concepts are judiciously combined, they have the potential to impart new and unprecedented structural multi-functionality. The success of super-
configurable multifunctional structures will also be dependent on: (a) the development of robust modeling and design tools, (b) a fundamental understanding of the complex and time-variant properties of the material and mechanization structure in diverse environments, (c) processing techniques to readily achieve a range of desired multifunctional structures with minimum alteration of weight, and (d) integrated control systems functioning in operating environments that can vary widely.

**Objective:** (a) To provide scientific basis for the development of new “morphing” aerospace platforms capable of altering their shape, functionality and mechanical properties in response to the changes in surrounding environments or operating conditions, and (b) to identify and better understand new basic research concepts for structural reconfiguration, adaptive materials, micro-devices for sensing, communication and actuation, energy transduction mechanisms and system integration that would establish aerospace platforms as reconfigurable multifunctional structures.

Research Concentration Areas: Proposals are expected to address research ideas for super-configurable multifunctional structures that are either motivated by the above-cited system level concept or similar operational environments. Due to the highly coupled nature of various research topics involved, multi-disciplinary teaming between co-recipients and interactions with other pertinent research and development efforts will be highly encouraged. Research areas include but are not limited to:

- New adaptive materials or novel chemistry (such as reconfigurable granular/colloidal assemblies, shape memory composites, phase-change materials, multi-ferroic interactions, novel particle coupling in microvascular networks, in-situ synthesis of materials, reversible chemistry, surfaces with reversible adhesion) which may allow reversible modulation of mechanical or electromagnetic properties in effective manner.

- Energy efficient and light-weight means for distributed actuation of reconfigurable structures via the intelligent amplifications of materials with multi-scale kinematic elements, or cells, to produce a “mechanized” material systems with tailored deformation modes.

- New and further miniaturized micro-devices allowing greater flexibility in electronic functionality and full integration of sensing, communication, actuation and propulsion capabilities into load-bearing structures of UAV for higher system efficiency.

- Networking capability to sense external stimuli (such as wind gusts or changes in temperature) and provide feedback to the flight control system (such as morphing of the vehicle shape) in much the same way that biological tissue is replete with nerves and muscles to sense and interact with the environment.

- New triggering mechanisms for reconfiguration that may be distributed throughout the structures (rather than a single large actuation source) and entail minimal requirements of connection through embedded wiring and additional power.
• Utilization of thermal and kinetic energy from external heat and structural vibration in powering the reconfiguration process.
• Autonomic protection or defense of reconfigurable structures to high-threshold mechanical, thermal, and electromagnetic events via the use of the event energy to (a) trigger repair, (b) initiate mass flow, enhanced emission, reduced absorbance, or enhanced reflection, and (c) synthesize robust and passivating materials.
• Morphing load-bearing joints which allow motion to occur but efficiently carry primary aerodynamic loads during reconfiguration.
• Assessment of the system stability starting from a compact structure delivered in space-deployable configuration under harsh loading conditions (such as Mach 6) to subsequent transition to a micro-UAV in flight in the lower atmosphere and a potential means of enabling survival of structures.
• Processing and manufacturing sciences for the control of morphology, topography and spatial configuration of reconfigurable multifunctional structures at various structural levels
• Multifunctional design rules for the integration of materials, devices, structures, actuation mechanisms and aerodynamic constraints into a concise system. This requires a broad understanding of the individual components, but more importantly an understanding of the interactions between them.
• Modeling and simulation of multi-state/continuum behavior within physics-based framework with a potential to yield adaptive functionality.

Impact: New classes of reconfigurable multifunctional structures, which allow combined changes of shape, functionality and mechanical properties on demand, are expected to result in revolutionary breakthrough of pervasive morphing ability for a variety of aerospace platforms and defense systems. This can lead to greater operational flexibility (and in some cases performance), resilience, and the ability to form systems more rapidly.

Program Scope: Typical awards could be $125-250K. It is expected that single investigator projects will be awarded; however, multidisciplinary team proposals will also be considered. Projects that include collaboration with researchers at the Air Force Research Laboratory are encouraged.

Dr. B. L. (“Les”) Lee AFOSR/RSL (703) 696-8483

11. Prognosis of Aircraft and Space Devices, Components, and Systems

Description: Prognosis is a vision for a future capability that has the potential to dramatically increase the US Air Force operational capability with increased safety and reduces risk while minimizing life-cycle operational and support (O&S) cost. USAF strongly needs prognosis capability in their deployed aircraft and space platforms. Pervasive prognosis capability is needed at all levels of complexity, from material level through device and component levels up to system level. The prognosis capability should cover (1) quantitative assessment of individual
performance by serial number or other unique identifier; (2) quick and responsive prediction of future performance capability and potential degradation; (3) delivery of actionable information to the operator and in-field commanders for taking corrective actions in a timely manner to insure mission completion while minimizing risk and operating cost. Performance assessment and prediction should be accurate and precise with defined confidence interval and quantified risk. in near real-time. This DCT will address the fundamental basic research challenges that need to be overcome in order to realize this long-term vision.

Background: The success of USAF air and space missions relies on the availability of complex systems that range from aircraft and space platforms to electronic devices and sensors that are expected to perform as needed with high confidence and reliability. Materials in USAF flight systems include a wide variety of metals, composites, polymers, and ceramics and combinations thereof ranging in forms from nanoscale, to films and coatings, to complex structural components and structural assemblies. These systems are asked to deliver the designed performance over extended periods of time and often beyond their original design life. Past design practices have relied on various methodologies for predicting in-field performance, from safe-life to damage tolerance to reliability-based metrics such as mean time between failures (MTBF) initially pioneered for electronic components. However, the initial design predictions of in-service performance have often been inadequate resulting in high costs for maintenance and repair, lack of availability or readiness, and in some cases loss of crew. Responses to these shortcomings include in-service inspection requirements such as for aircraft structural integrity (ASIP), mandated corrosion inspection and repairs, line replacement unit upgrades in avionics, and various reliability improvement programs. Great expense to the USAF occurs as a result of unnecessary and damaging inspections driven by these worst-case limits. Repetitive inspections are required to give a needed level of confidence that the damage state has not been missed. This methodology and mind-set has driven the entire field of component and system reliability for non-electronics to focus the research on end-of-life scenarios – large cracks and extensive corrosion, for example. In the field of electronics, line replaceable unit (LRU) actions are driven by an assumption that all LRUs behave at the level of the worst case. The situation has reached in which continuation of current practice leads to escalating and unsustainable O&S costs. Reusable space access platforms such as the national space transportation system orbiter end up requiring extensive ground time between missions to assure reliably the ability to launch the next mission for that platform. In addition, some space operations do not even allow for replacements!

To address this situation, a radical new approach is needed, in which individuals rather than statistical worst case scenarios must be considered. The ability is needed to predict by serial number or other unique identifier when a device or component, or system is reaching a state where it must be repaired, upgraded, or graciously replaced. This ability to perform individual predictions will replace the current practice which relies on system or fleet worst-case scenarios driven by the statistics of the lower tail of the reliability distribution. Such a revolutionary
approach requires a diverse multitude of new capabilities ranging from science and technology know-how to fleet management and operations research. However, this DCT will focus on the fundamental basic research challenges that need to be addressed in order to make it possible.

**Basic Research Objectives:** Structural prognosis, as a vision for a future capability, is based on the integration of three concurrent and distinct categories: (1) multi-level sensing-based state awareness (material, structural, loading, operational environment, etc.); (2) material-level modeling and predictive simulation of damage progression; (3) structural-level modeling and predictive simulation of long-term load-bearing capability under operational loads and extreme environmental conditions. The integration of these three categories in a robust predictive-analysis tool will offer on-demand continuous assessment capability of upcoming structural state under evolving operational requirements and threat environment thus forming the basis of structural state prognosis. Many fundamental basic research challenges in each of these three categories exist; among the top ranked ones, we list the following:

(1) multi-level sensing-based state awareness (material, structural, loading, operational environment, etc.): (a) comprehensive characterization of local microstructural material evolution capable of providing a globally-selective and evolving “fingerprint” of the material state in support of damage evolution modeling; assessment of material state and damage progression through synergistic application and exploitation of NDE capabilities; (b) break-through sensors (light-weight, permanently installed, autonomous, durable, and reliable) for real-time sensing of material state and of external boundary conditions in extreme harsh environments. (c) capability to selectively sense of various evolving microstructural mechanisms contributing to key damage states in complex built-up structures and to overcome the challenge of detecting damage in inaccessible locations via large-scale interrogation and state sensing strategies.

(2) material-level modeling and predictive simulation of damage progression: (a) a set of local and global parameters that identify and describe damage in the complex engineered material systems needed for future flight structures; define the parameters (tensor? scalar?) that describe the state of damage in a anisotropic inhomogeneous material volume subjected to fatigue loading and identify how it could be possibly measured; (b) develop micromechanics-based material state and damage evolution models that can predict the variability within macro-mechanical damage models; determine the principal microstructural characteristics that can be related to remaining ultimate life and can be measured in the field; (c) develop fundamental material simulation methods capable of providing accurate predictions of material state, damage evolution, and ultimate life in the presence of material processing and component manufacturing variability, and loading path dependency.
(3) structural-level modeling and predictive simulation of long-term load-bearing capability under operational loads and extreme environmental conditions: (a) develop a robust and reliable multi-scale damage evolution model to predict damage growth from material initiation site to aircraft-level structural failure within the assumptions of USAF damage-tolerant structures; (b) evolve from the predictive modeling of crack nucleation and progression at a single site under single loading condition to the prediction of crack population nucleation and evolution at multiple sites and at various structural levels from component to the full assembly to give a prognosis of probability distribution functions of cracks and of the coalescence of multisite crack damage for different damage nucleation mechanisms (mechanical fatigue, stress-corrosion; slightly atypical manufacturing anomalies); (c) develop integration strategies for fusing probabilistic state awareness information from global/local aircraft state sensing with damage evolution models and advanced probabilistic structural modeling to provide key sensitivity factors and engineering confidence intervals and achieve aircraft-level predictive modeling capable of near real-time hot spot identification and localization.

**Program Scope:** Two to four awards of $100-250k/year for 3 years are to be expected. The proposed research effort is expected to address fundamental breakthroughs in at least two of the three major research categories outlined above. Collaboration with scientists in the Air Force Research Laboratory (AFRL) is encouraged, but not required. White papers are encouraged as an initial and valuable step prior to proposal development. The white papers that are found of interest will be encouraged to develop into full proposals.

Dr. David Stargel/AFOSR/RSA (703) 696-6961  
DSN 426-6961 FAX: (703) 696-8451  
E-Mail: david.stargel@afosr.af.mil

**Other Innovative Research Concepts**

AFOSR is always looking for new research ideas and is open to considering unique and revolutionary concepts. If you have an exciting idea that doesn't seem to fit within one of the more specific topic descriptions of this Broad Agency Announcements (BAA) detailing our current technical programs, you may submit it under this section of the BAA.

AFOSR’s goal is to create revolutionary scientific breakthroughs. This BAA seeks to invest in high payoff science and to identify challenging fundamental scientific problems relevant to the USAF in the 21st century. It is expected that proposals will describe cutting-edge efforts on basic scientific problems. Proposed research should investigate truly new and unique approaches and techniques that may enable revolutionary concepts with potentially high payoff relevant to Air Force mission.
Submission of a brief white paper (1-3 pages) describing the potential research effort is strongly encouraged prior to proposal submission. White Papers should briefly summarize your ideas, their scientific impact, and how they differ from what others are doing. Proposals not based on sound scientific or engineering principles will be quickly rejected. White papers will be reviewed by AFRL researchers familiar with the AF research interests in this area as well as suitable experts from academia. Copies of publications or student theses will not be considered as white papers.

Please include contact information including your mailing address, email address, telephone number, and fax number. This allows us to give prompt feedback to the proposer on the likelihood of a proposal being selected. We encourage you to send your white paper to:

Education and Outreach Programs

The Scientific and Technology Divisions of the Air Force Office of Scientific Research (AFOSR), the International Office (IO), and three overseas detachments, AOARD and EOARD and SOARD, are responsible for the management of several programs that improve science and engineering education in the U.S., and stimulate interactions between Air Force researchers and the broader international, as well as domestic, research community. Applications for these programs do not always require proposals but generally have specific deadlines, formats, and qualifications. Researchers applying for these programs should communicate with the point-of-contact (POC) listed in each program description.

1. United States Air Force National Research Council Resident Research Associateship (NRC/RRA) Program

The NRC/RRA Program offers postdoctoral and senior scientists and engineers opportunities to perform research at sponsoring Air Force laboratory sites. The objectives of this program are: (1) to provide researchers of unusual promise and ability opportunities to solve problems, largely of their own choice, that are compatible with the interests of the hosting laboratories; and (2) to contribute to the overall efforts of the Air Force laboratories.

Postdoctoral Research Associateships are awarded to U.S. citizens and permanent residents who have held doctorates for less than five years at the time of application. The awards are made initially for one year and may be renewed for a second year, and in some cases, a third year. A small number of associateships may be available for foreign citizens if laboratory funds are available.

Senior Research Associateships are awarded to individuals who have held doctorates for more than five years, have significant research experience, and are recognized internationally as experts in their specialized fields, as evidenced by numerous refereed journal publications, invited presentations, authorship of books or book chapters, and professional society awards of international stature. Although awards to senior associates are usually for one year, awards for periods of three months or longer may be considered. Renewals for a second and third year are possible. U.S. citizenship is not a requirement. Senior associates must be eligible for access to unclassified government information systems; eligibility is also subject to a successful background review and visit authorization that includes approved access to the Air Force base and its laboratory facilities. Associates are considered independent contractors, and receive a stipend from the NRC while carrying out their proposed research. Annual stipends increase with additional years past the Ph.D. An appropriately higher stipend is offered to senior associates. Awardees also receive a relocation reimbursement and may be supported with limited funds for professional travel.

An on-line application is available at: http://www.nationalacademies.org/rap.
2. United States Air Force-Summer Faculty Fellowship Program (SFFP)

The SFFP offers fellowships to university faculty to conduct research at one of the Air Force research facilities in the summer. The objectives of the Summer Faculty Fellowship Program are to: (1) stimulate professional relationships among SFFP fellows and the scientists and engineers in AFRL Technical Directorates and other Air Force research facilities; (2) elevate the awareness in the U.S. academic community of Air Force research needs and foster continued research at SFFP fellows' institutions; and (3) provide the faculty opportunities to perform high-quality research at AFRL Technical Directorates and other Air Force research facilities.

SFFP fellows conduct research in collaboration with Air Force researchers for a continuous summer period of eight to twelve weeks at the Technical Directorates of the Air Force Research Laboratory, the US Air Force Academy, or the Air Force Institute of Technology. A final report is required at the completion of the summer appointment.

Applicants must be U.S. citizens or permanent residents and have an earned Ph.D. in science or engineering. Fellows must be eligible for access to unclassified government information systems; the fellowship award is subject to a successful background review and visit authorization that includes approved access to an Air Force installation and its laboratory facilities.

Fellows are awarded in different categories including both early career investigator and senior investigator. The stipend is based on the category. Each SFFP award is for one summer. The SFFP fellow may reapply for up to two additional summers, for a maximum of three summer awards. Starting in Fiscal Year 2010, selected fellows may bring a graduate student with them to assist in research on their assignment.

An on-line application is available at: [http://www.asee.org/sffp/](http://www.asee.org/sffp/).
The program is currently administered by The American Society for Engineering Education (ASEE):
American Society for Engineering Education
1818 N St, NW Suite 600
Washington DC 20036
http://www.asee.org/sffp

Point of Contact (POC):
Mrs. Leslie Peasant, AFOSR/IO (703) 696-7316,
DSN 426-7316 FAX: 703) 696-7320
E-mail: leslie.peasant@afosr.af.mil

3. Engineer and Scientist Exchange Program (ESEP)

The Engineer and Scientist Exchange Program (ESEP) is a DOD effort to promote international cooperation in military research, development, and acquisition through the exchange of defense scientists and engineers (S&E). A prerequisite for establishing the program is a formal international agreement, a Memorandum of Understanding (MOU), with each participant nation. Currently, DoD has signed ESEP agreements with Australia, Canada, Chile, Egypt, France, Germany, Israel, Italy, Japan, Norway, Poland, Republic of Korea, Singapore, Sweden, Spain, The Netherlands, and the United Kingdom. The primary goals of ESEP are to:

- Broaden perspectives in research and development techniques and methods.
- Form a cadre of internationally experienced professionals to enhance USAF research and development programs.
- Gain insight into foreign research and development methods, organizational structures, procedures, production, logistics, testing, and management systems.
- Cultivate future international cooperative endeavors.
- Avoid duplication of research efforts among allied nations.

Air Force personnel are selected in a competitive process and are assigned for a 2-year tour. This may be preceded by 6 months of language training. Ad hoc placements (non-competitive) can be initiated by research sites; however, these are funded solely by their originators. Foreign S&E are usually assigned to US DoD organizations for 12 month periods; although assignments can be for shorter or longer duration. Each country bears the cost of supporting its participants in the program. AFOSR/IO is responsible for managing placement of all ESEP exchanges within the USAF, and is the "one face to the customer" for all USAF ESEP actions. SAF/IAPQ (Armaments Cooperation Division, Deputy Under Secretary of the Air Force, International Affairs), the executive agent, provides policy guidance. The Asian and European Offices of Aerospace Research and Development (AOARD/EOARD) are AFOSR field offices located in Tokyo and London. These offices act as overseas program liaison offices for US ESEP personnel working in Asia and Europe.
AFOSR/IO implements all actions for USAF participants once their selection is approved, and for the placement of foreign ESEP participants in Air Force organizations.

Point of Contact (POC):
Dr. Mark Maurice, AFOSR/IO, (703) 588-1772
DSN 425-1772 FAX: (703) 696-7320
E-mail: mark.maurice@afosr.af.mil

4. Air Force Visiting Scientist Program

The AF Scientist Visiting Scientist Program provides outstanding Air Force scientists and engineers the opportunity to conduct full-time, "hands-on" research-related work in a leading U.S. University or industry laboratory for a period of up to 179 days on a temporary duty status funded by AFOSR. The university or industrial laboratory provides a letter of invitation, and makes facilities, equipment, and resources available. The host laboratory must be located in the United States. Typically the researcher is an Air Force scientist or engineer, at least at the GS-13 level or its military equivalent. The applicant must be currently active in his or her field of expertise, be widely recognized as an expert, and have a strong publication record. The applicant must write a project proposal, preferably not to exceed ten pages, but of sufficient depth and scope for evaluation by scientists at participating organizations. Hands-on laboratory research-related work is an essential program element. At the completion of the TDY, the visiting researcher is required to submit a written report detailing his or her experiences and results of the project. In addition, the visiting researcher may be required to give a seminar presentation at the Air Force laboratory or at AFOSR and to provide feedback for purposes of program assessment. Upon completion of the assignment the researcher returns to his or her Air Force laboratory.

Point of Contact (POC):
Mrs. Leslie Peasant, AFOSR/IO, (703) 696-7316
DSN 426-7316, FAX: (703) 696-7320
E-mail: leslie.peasant@afosr.af.mil

5. Window on Science (WOS) Program

The Window on Science (WOS) program facilitates technical interactions on fundamental research via direct contact between distinguished foreign researchers and Air Force Research Laboratory scientists and engineers. The WOS program sponsors foreign scientists and engineers to visit Air Force scientists and engineers at USAF sites typically within the U.S., but may also include other domestic or overseas locations. Although WOS visits are designed to be short-term in nature, visits to multiple sites are encouraged. In order to present their research to a greater audience, and to further Air Force interests, WOS visitors may also combine visits to Air Force R&D organizations with visits to Army, Navy,
other government, university, or industrial facilities. The AFOSR international Detachment 1, the European Office of Aerospace Research and Development (EOARD), London, United Kingdom, manages this program for Europe, Africa, the Middle East, and countries of the former Soviet Union. Detachment 2, the Asian Office of Aerospace Research and Development (AOARD), Tokyo, Japan manages this program for the remainder of Asia and the Pacific Rim. Southern Office of Aerospace Research and Development (SOARD), located in Santiago, Chile manages the WOS program for the Americas, but administers the program from AFOSR/IO located in Arlington, Virginia. Participants in the WOS program will be foreign non-government researchers identified as subject matter experts by AFRL program managers, and whose visit benefits Air Force scientists and engineers. Travelers may be eligible to receive payment for their services; however, base clearance requests for unpaid non-government visitors can also be handled under the WOS program. Visitors will normally present seminars to discuss their work, which may or may not have been funded by the Air Force. The WOS program is not intended as a substitute for research programs, internships, associateships, or personnel exchange programs. The lead-time necessary to arrange a WOS visit is generally three months. A letter report from the traveler is required on completion of the visit.

EOARD: http://www.london.af.mil/

6. Windows on the World (WOW) Program

The Windows on the World program provides outstanding Air Force scientists and engineers the opportunity to conduct full-time research at a foreign (non-government) host laboratory, or to perform full-time science and technology assessment activities for a period up to 179 days on temporary duty (TDY) status. The TDY is fully funded by AFOSR. Upon completion of the assignment the researcher returns to his or her Air Force activity. The host laboratory provides facilities, resources, and a letter of invitation. Typically the researcher is an Air Force scientist or engineer, at least at the GM/GS-13 level or its military equivalent. The researcher must be currently active in his or her field of expertise, be widely recognized as an expert, and have a strong publication record. Some knowledge of the language used by the researcher's host institution is desirable. The applicant must write a research proposal, preferably not to exceed 10 pages, but of sufficient depth and scope, so that it can be evaluated by the scientists at the participating organizations. The proposal must be endorsed by the applicant's Air Force Research Laboratory Technical Directorate Chief Scientist. Non-laboratory applicants, such as researchers at the Air Force Academy and Air Force Institute of Technology, should pass their proposals through the Chief Scientist of an AFRL Technical Directorate. Proposals that focus tightly on specific research problems or specific science and technology assessment topics will merit
greater consideration than those that are of a survey nature. The researcher is required to submit a written report detailing his or her research effort and findings at the completion of the TDY. In addition, the researcher may be required to give a seminar-style presentation at the Air Force laboratory and/or at AFOSR and provide feedback for purposes of program assessment. Lead-time to set up a "Windows" visit is approximately four months. More detailed information is contained in the AFOSR Brochure, “Windows on the World”.

Point of Contact (POC):
Dr. Mark Maurice, AFOSR/IO, (703) 588-1772
DSN 425-1772 FAX: (703) 696-7320
E-mail: mark.maurice@afosr.af.mil

7. National Defense Science and Engineering Graduate (NDSEG) Fellowship Program

The NDSEG Fellowship Program is a Department of Defense (DoD) fellowship program sponsored by Air Force Office of Scientific Research (AFOSR), Army Research Office (ARO), Office of Naval Research (ONR), and the High Performance Computing Modernization Program (HPCMP). The DoD is committed to increasing the number and quality of our Nation’s scientists and engineers. The actual number of awards varies from year to year, depending upon the available funding. The NDSEG Fellows do not incur any military or other service obligations. NDSEG Fellowships are highly competitive and will be awarded for full-time study and research.

An awardee must be enrolled in a graduate program by Fall 2011; the graduate program must lead towards a Ph.D. Preference will be given to applicants in one, or closely related to one, of the following specialties: Aeronautical and Astronautical Engineering; Biosciences; Chemical Engineering; Chemistry; Civil Engineering; Cognitive, Neural and Behavioral Sciences; Computer and Computational Sciences; Electrical Engineering; Geosciences; Materials Science and Engineering; Mathematics; Mechanical Engineering; Naval Architecture and Ocean Engineering; Oceanography; and Physics.

The NDSEG Fellowship Program is open only to applicants who are citizens or nationals of the United States. Persons who hold permanent resident status are not eligible to apply. NDSEG Fellowships are intended for students at or near the beginning of their graduate study in science or engineering. Applications are encouraged from women, persons with disabilities, and members of ethnic and racial minority groups historically underrepresented in science and engineering fields, including African American, American Indian and Alaska Native, Native Hawaiian and Pacific Islander, and Hispanic persons.

The duration of an NDSEG Fellowship is thirty-six months cumulative starting in the fall of 2011. NDSEG Fellows may choose as their fellowship institution any
accredited U.S. institution of higher education offering doctoral degrees in science or engineering. The availability of funds for the second and third years of each three-year award is contingent upon satisfactory academic progress.

In FY2011 NDSEG fellowships will provide stipends of $30,500, $31,000 and $31,500 in the first, second, and third years, respectively. Additionally, the NDSEG fellowship will pay the fellow's full tuition, required fees (not to include room and board) and minimum health insurance coverage offered through the institution, up to a total value of $1,000. Any excess insurance costs will be the responsibility of the fellow and can be paid using the stipend. The stipends will be prorated monthly based on a twelve-month academic year. If the fellow is not enrolled in an institutionally approved academic study and/or research during the summer months, financial support will not be provided. There are no dependency allowances. Persons with disabilities will be considered for additional allowances to offset special educational expenses.

An on-line application is available at: http://www.asee.org/ndseg.

This program is currently administered by the American Society for Engineering Education (ASEE):

NDSEG Fellowship Program c/o American Society for Engineering Education:
1818 N Street, N. W.
Suite 600 Washington, D. C., 20036 (202) 331-3516 Fax: (202) 265-8504 E-mail: ndseg@asee.org
http://www.asee.org/ndseg

Mr. Neville Thompson, AFOSR/RSPP, (703) 588-1779
DSN 425-1779, FAX: (703) 696-7364 E-mail: neville.thompson@afosr.af.mil

Alternate POC:
Dr. Patrick Bradshaw, AFOSR/RSPP, (703) 588-8492

E-mail: patrick.bradshaw@afosr.af.mil

8. The Awards to Stimulate and Support Undergraduate Research Experiences (ASSURE)

The ASSURE program supports undergraduate research in DoD relevant disciplines and is designed to increase the number of high-quality undergraduate science and engineering majors who ultimately decide to pursue advanced degrees in these fields. A strong U.S. science and engineering workforce is of clear interest to the DoD, as the capability of producing superior technology is essential for future national security.
The ASSURE program aims to provide valuable research opportunities for undergraduates, either through ongoing research programs or through projects specially designed for this purpose. Research projects should allow high quality interaction of students with faculty and/or other research mentors and access to appropriate facilities and professional development opportunities. Active research experience is considered one of the most effective ways to attract and retain talented undergraduates in science and engineering.

ASSURE projects must have a well-defined common focus that enables a research related experience for students. Projects may be based in a single discipline or academic department, or interdisciplinary or multi-department research opportunities with a strong intellectual focus. Each proposal should reflect the unique combination of the proposing institution’s interests and capabilities. Applicants are encouraged to involve students in research who might not otherwise have the opportunity, particularly those from institutions where research programs are limited. Thus, a significant fraction of the student participants should come from outside the host institution. In addition, DoD is interested in strengthening institutions with limited research programs and especially encourages proposals that help to enhance the research infrastructure in predominantly undergraduate four-year institutions. Student participants must be citizens or permanent residents of the United States or its possessions.

The DoD ASSURE budget is $4.5 million annually. DoD expected ASSURE budget for new projects is approximately $1.5 million; this funding will be distributed among fifteen to twenty new ASSURE awards. DoD relevance will be considered in making funding decisions. Projects may be carried out during the summer months, during the academic year, or both. Sites may be proposed for durations of one to five years, with a three-year duration being typical.

DoD executes the ASSURE program collaboratively with the National Science Foundation (NSF) through its Research Experiences for Undergraduates (REU) Sites Program. DoD funded ASSURE sites will be selected by DoD scientists and engineers, but will be overseen by NSF as part of the NSF portfolio of REU Sites. There is no separate application for the ASSURE program; ASSURE funding is awarded through the NSF REU Sites Program.

Primary POC:
Dr. Patrick Bradshaw, AFOSR/RSPP, (703) 588-8492
DSN 425-8492, FAX: (703) 696-7320
E-mail: patrick.bradshaw@afosr.af.mil
**Special Programs**

AFOSR provides the support for research and education through the following unique programs: The Small Business Technology Transfer Program (STTR); the Historically Black Colleges and Universities and Minority Institutions (HBCU/MI) Program; and the University Research Initiative (URI) Program. Other support deemed appropriate by AFOSR, such as conferences and workshops, may also be sponsored.

1. **Small Business Technology Transfer Program (STTR)**

The primary objective of the AF STTR program is to involve small businesses in AF-relevant defense research, and enable them to commercialize their innovative technologies for the advancement of U.S. economic competitiveness. Specifically, the STTR Program is designed to provide an incentive for small companies, academic institutions, and non-profit research institutions, including federally-funded research and development centers (FFRDC), to work together to move emerging technical ideas from the laboratory to the marketplace.

Each STTR proposal must be submitted by a team that includes a small business (as the prime contractor for contracting purposes) and at least one academic or non-profit research institution, which have entered into a Cooperative Research and Development Agreement for the proposed effort. The STTR has two phases: Phase I efforts are up to $100,000 for a period not to exceed one year; and Phase II projects are two year efforts for amounts up to $750,000. More information regarding the AF STTR can be found at: [http://www.sbirsttrmall.com/TopicPreRelease/Default.aspx](http://www.sbirsttrmall.com/TopicPreRelease/Default.aspx).

**2. Historically Black Colleges and Universities and Minority Institutions (HBCU/MI) Program**

AFOSR HBCU/MI program consists of two main components:
**AFOSR Core Research.** Research proposals from HBCU/MI are reviewed by AFOSR Program Managers as part of their core program and may be funded from funds set aside by the AFOSR Director.

**Department of Defense Infrastructure Support Program for Historically Black Colleges and Universities and Minority Institutions.** The DoD has been providing grants for research and educational equipment at HBCU/MI. This program is administered by the Army Research Office, in collaboration with the AFOSR. Schools interested in this program should look for the Broad Agency Announcement that is usually published in the Fall of each year in the ARO webpage. The BAA is linked through the AFOSR Web site at [http://www.wpafb.af.mil/AFRL/afosr/](http://www.wpafb.af.mil/AFRL/afosr/), under "Research Areas"; “Educational, Outreach and Special Programs” at [http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=9304](http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=9304).

Mr. Ed Lee, AFOSR/RSA, (703) 696-7318  
DSN 426-7318, FAX: (703) 696-7320  
Email: ed.lee@afosr.af.mil

**3. Young Investigator Research Program (YIP)**

The Air Force YIP supports scientists and engineers who have received Ph.D. or equivalent degrees in the last five years and show exceptional ability and promise for conducting basic research. The objective of this program is to foster creative basic research in science and engineering; enhance early career development of outstanding young investigators; and increase opportunities for the young investigator to recognize the Air Force mission and related challenges in science and engineering.

Individual awards will be made to U.S. institutions of higher education, industrial laboratories or non-profit research organizations where the principal investigator is a U.S. citizen, national or permanent resident; employed on a full-time basis and hold a regular position. Researchers working at the Federally Funded Research and Development Centers and DoD Laboratories will not be considered for the YIP competition. Each award will be funded at the $120K level for three years. Exceptional proposals will be considered individually for higher funding levels and longer duration. Specific information about YIP proposal preparation and submission can be found at AFOSR’s Web site: [http://www.wpafb.af.mil/AFRL/afosr/](http://www.wpafb.af.mil/AFRL/afosr/), under “Other Links”; “List of Broad Agency Announcements”; the current Young Investigator Research Program under the BAA list.

Dr. Djuana Lea, AFOSR/RSE, (703) 696-9558  
DSN 426-9558, FAX: (703) 696-7320  
Email: djuana.lea@afosr.af.mil
University Research Initiative (URI) Programs

The URI programs are executed under the policy guidance of the Office of the Deputy Under Secretary of Defense for Laboratories and Basic Research, to enhance universities' capabilities to perform basic science and engineering research and related education in science and engineering areas critical to national defense. The URI programs include: the Defense Research Instrumentation Program (DURIP); the Multidisciplinary Research Program of the University Research Initiative (MURI); and the Presidential Early Career Awards for Scientists and Engineers. A short description of each program is listed below. Specific information on each URI program Broad Agency Announcement can be found on the AFOSR Web site at http://www.wpafb.af.mil/AFRL/afosr/, under “Research”; “Educational, Outreach and Special Programs” at http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=8972

1. Defense University Research Instrumentation Program (DURIP)

This program is administered through the Air Force Office of Scientific Research, the Army Research Office, and the Office of Naval Research. The DURIP program is for the acquisition of major equipment to augment current or develop new research capabilities to support research in the technical areas of interest to the DoD. The competition is open only to U.S. institutions of higher education, with degree granting programs in science, math, and/or engineering. Proposals to purchase instrumentation may request $50,000 to $1,000,000. Awards are typically one year in length. The latest DURIP BAA can be found at http://www.wpafb.af.mil/AFRL/afosr/, under “Other Links”; “List of Broad Agency Announcements”; “Broad Agency Announcements – Current” or “Broad Agency Announcements – Archive” as applicable.

Katie Wisecarver, AFOSR/RSL, (703) 696-9544
DSN 426-9544, FAX: (703) 696-7363
E-mail: Katie.Wisecarver@afosr.af.mil

2. Multidisciplinary Research Program of the University Research Initiative (MURI)

MURI supports basic research in the science and engineering areas intersecting more than one traditional discipline. The program is focused on multidisciplinary team efforts to address issues of critical concern to the DoD and the AF. The goal of this program is to advance defense research, accelerate technology transition, and educate scientists and engineers in the interdisciplinary areas important to national defense.

MURI is a DoD-wide program which complements other DoD programs that support university research through the single-investigator awards. The awards are typically for a
period of three years with two additional years as options. New awards can be funded up
to $1.5M per year, with the actual amount contingent upon the availability of funds, the
specific topic and the scope of the proposed work. All the award selections result from a
merit based competition of the proposals. Proposal submission is a two-stage process
including white papers and full proposals. Details of the proposal submission process and
the specific MURI topics under the solicitation can be found in the most recent MURI
announcement at http://www.wpafb.af.mil/AFRL/afosr/, under “Other Links”; “List of
Broad Agency Announcements”; “Broad Agency Announcements – Current” or “Broad
Agency Announcements – Archive” as applicable.

Laura Cooney, AFOSR/RSA, (703) 696-9517
DSN 426-7315, FAX: (703) 696-1003
E-mail: laura.cooney@afosr.af.mil

3. Presidential Early Career Award in Science & Engineering (PECASE)

The National Science & Technology Council (NTSC) sponsors PECASE awards to
recognize outstanding young scientists and engineers at the outset of their
careers. The PECASE embodies the high priority placed by the President on
maintaining the leadership position of the US in science by producing outstanding
scientists and engineers and nurturing their continued development. The Awards
will identify a cadre of outstanding scientists and engineers who will broadly
advance science and the missions important to the participating agencies.

The PECASE recognize some of the nation’s finest scientists and engineers who,
while early in their research careers, show exceptional potential for leadership at
the frontiers of scientific knowledge during the 21st century. The Awards foster
innovative and far-reaching developments in science and technology, increase
awareness of careers in science and engineering, give recognition to the scientific
missions of participating agencies, enhance connections between fundamental
research and national goals, and highlight the importance of science and
technology for the nation’s future. The awards are conferred annually at the White
House following recommendations from participating agencies.

To be eligible for the PECASE, an individual must be a US citizen, national, or
permanent resident with no more than five years from receipt of the doctorate
degree. Each award will be $200K per year for five years. AFOSR awardees will
be selected from among highly qualified institute of higher education principal
investigators to the AFOSR or former National Defense Science and Engineering
Graduate (NDSEG) fellowship recipients. Candidates must hold tenure-track
positions at U.S. universities. An individual wishing to apply for the program must
be nominated by an AFOSR program manager and have a proposal that
addresses Air Force research interests as described in the current AFOSR Broad
Agency Announcement (BAA).

Dr. Djuana Lea, AFOSR/RSE (703) 696-9558,
Conferences and Workshops

The Air Force Office of Scientific Research (AFOSR) understands that it is essential for the scientific community to maintain clear lines of communication for thorough and well-reasoned research to be accomplished. Support for conferences and workshops have proven to be an extremely valuable tool for AFOSR. They allow our technical managers the opportunity to receive current information in their respective disciplines. They also allow AFOSR the opportunity to inform the research community of the current thrust of AFOSR's programs. Conferences and workshops constitute a key forum for research and technology interchange. AFOSR accepts proposals from all recognized scientific, technical, or professional organizations that qualify for federal tax-exempt status. AFOSR's financial support through appropriate financing vehicles for conferences and workshops is dependent on the availability of funds, program manager's discretion, and certain other restrictions including:

- AFOSR support for a workshop or conference is not to be considered as an endorsement of any co-sponsoring organization, profit or non-profit.
- The subject matter of the conference or workshop is scientific, technical, or involves professional issues that are relevant to AFOSR's mission of managing the Air Force basic research program.
- The purpose of our support is to transfer federally developed technology to the private sector or to stimulate wider interest and inquiry into the relevant scientific, technical, or professional issues relevant to AFOSR's mission of managing the Air Force basic research program. Proposals for conference or workshop support should be submitted a minimum of six months prior to the date of the conference. Proposals should include the following:

**Technical Information:**

- Summary indicating the objective(s) of the conference/workshop
- Topic(s) to be covered and how they are relevant to AFOSR's mission of managing the Air Force basic research program
- Title, location, and date(s) of the conference/workshop
- Explanation of how the conference/workshop will relate to the research interests of AFOSR identified in Section III of the Broad Agency Announcement (BAA)
- Chairperson or principal investigator and his/her biographical information
- List of proposed participants and method (or copies) of announcement or invitation
- A note whether foreign nationals will be present
Evaluation Criteria For Conference Support:

Anticipated use of funds requested from AFOSR proposals for conferences and workshops will be evaluated using the following criteria. All factors are of equal importance to each other:
- Technical merits of the proposed research and development.
- Potential relationship of the proposed research and development to the Department of Defense.
- The qualifications of the principal investigator(s) or conference chair(s).
- Overall realism and reasonableness of cost including proposed cost sharing when applicable and availability of funds.

Cost Information (In addition to information required on SF 424 (R&R) Budget forms):
- Total project costs by major cost elements
- Anticipated sources of conference/workshop income and amount from each source

If you have questions concerning the scientific aspects of a potential proposal to AFOSR for conference or workshop support, please contact the program manager listed in Section I of the BAA responsible for the particular scientific area of the conference/workshop.

II. Award Information

1. In Fiscal Year 2010, AFOSR managed funding support for approximately 2,700 grants, cooperative agreements, and contracts, totaling $450 million, to about 515 academic institutions and industrial firms. This included grants, cooperative agreements and contracts to academic institutions, non-profit organizations, and industry. Approximately $200M is available for support of actions awarded through this BAA process. Awards average $150,000 per year and may be proposed for up to five years. Awards may start any time during the fiscal year.

2. The Government anticipates the award of grants, cooperative agreements or contracts under this BAA.

III. Eligibility Information

All responsible, potential applicants from academia and industry are eligible to submit proposals. AFOSR particularly encourages proposals from small businesses; however, no portion of this BAA is set aside for a specific group.
Proposals from Federal Agencies, including subcontracting/subrecipient efforts will not be evaluated under this BAA. Federal agencies should contact the primary POCs listed under each technical area to discuss funding through the internal Government procedures.

IV. Application and Submission Information

1. **Address to Request Announcement Package** – This announcement may be accessed from the Internet at the Grants.gov web site (http://www.grants.gov). See ‘For Electronic Submission’ below. A copy of this BAA is also posted on FedBizOpps.gov (www.fbo.gov).

2. **Marking of Proposals** – As previously stated, AFOSR is seeking white papers and proposals that do not contain proprietary information. If proprietary information is submitted, AFOSR will make every effort to protect the confidentiality of the proposal and any evaluations. However, under the Freedom of Information Act (FOIA) requirements, such information (or portions thereof) may potentially be subject to release. If protection is desired for proprietary or confidential information, the proposer must mark the proposal with a protective legend found in FAR 52.215-1(e), Instructions to Offerors – Competitive Acquisition (Jan 2004), (modified to permit release to outside – Non-government evaluators and support contractors retained by AFOSR. See Section V). It is the offeror’s responsibility to notify AFOSR of proposals containing proprietary information and to identify the relevant portions of their proposals that require protection. The entire proposal (or portions thereof) without protective markings or otherwise identified as requiring protection will be considered to be furnished voluntarily to AFOSR without restriction and will be treated as such for all purposes. Since the Government anticipates the award of either grants, cooperative agreements, or contracts, this statement is applicable to proposals for all three of these potential instruments.

3. **Content and Form of Application Submission** –

   a. **White Paper.** Before submitting a research proposal, you may wish to further explore proposal opportunities. You can do this by contacting the appropriate AFOSR program manager who can provide greater detail about a particular opportunity; the program manager may then ask for a white paper. However, in your conversations with a Government official, be aware that only warranted contracting and grants officers are authorized to commit the Government.

   If you prefer, or the program manager requests, you may submit a White Paper, which should briefly describe the proposed research project’s (1) objective, (2) general approach, and (3) impact of Department of Defense (DoD) and civilian technology. The white paper may also contain any unique capabilities or experience you may have (e.g., collaborative
research activities involving Air Force, DoD, or other Federal laboratory.) The Program Manager may have additional guidelines regarding form, content and length of preliminary proposals so pay particular attention to the requirements included under each topic area. For additional information regarding White Papers, please see the AFRL BAA Guide for Industry at http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=6790.

White Paper Format

- Paper Size – 8.5 x 11 inch paper
- Margins – 1 inch
- Spacing – single or double spaced
- Font – Times New Roman, 10 or 12 point
- Copies – as discussed with the Program Manager
- Content – as described above
- Length – as indicated in specific topic areas

b. Full Proposals. The proposal may be submitted either electronically or in hard copy form, but not both. All proposers must include the SF 424 (R&R) form as the cover page. Unnecessarily elaborate brochures, reprints or presentations beyond those sufficient to present a complete and effective proposal are not desired. To convert attachments into PDF format, Grants.gov provides a list of PDF file converters at http://www.grants.gov/help/download_software.jsp

Full Proposal Format

- Paper Size – 8.5 x 11 inch paper
- Margins – 1 inch
- Spacing – single or double spaced
- Font – Times New Roman, 10 or 12 point
- Page Limitation – None, although unnecessarily elaborate proposals are not desirable.
- Attachments – submit in PDF format (Adobe Portable Document Format)
- Copies for hardcopy submissions – (one original, number of copies as discussed with the Program Manager)
- Content – as described below

(1) Advance Preparation For Electronic Submission - Electronic proposals must be submitted through Grants.gov. There are several one-time actions your organization must have completed before it will be able to submit applications through Grants.gov. Well before the submission deadline, you should verify that the persons authorized to submit proposals
for your organization have completed those actions. If not, it may take them up to 21 days to complete the actions before they will be able to submit applications.

The process your organization must complete includes obtaining a Dun and Bradstreet Data Universal Numbering System (DUNS) number, registering with the Central Contract Registry (CCR), registering with the credential provider, and registering with Grants.gov. (Designating an E-Business Point of Contact (EBiz POC) and obtaining a special password called MPIN are important steps in the CCR registration process.) Go to http://www.grants.gov/applicants/get_registered.jsp. Use the Grants.gov Organization Registration Checklist at http://www.grants.gov/assets/Organization_Steps_Complete_Registration.pdf to guide you through the process. To submit a proposal to through Grants.gov, applicants will need to download Adobe Reader. This small, free program will allow you to access, complete, and submit applications electronically and securely. To download a free version of the software, visit the following web site: http://www.grants.gov/help/download_software.jsp. Consult Grants.gov to ensure you have the required version of Adobe Reader installed. Should you have questions relating to the registration process, system requirements, how an application form works, the submittal process or Adobe Reader forms, call Grants.gov at 1-800-518-4726 or support@Grants.gov for updated information.

(2) Submitting the Application

(a) For Electronic Submission – Application forms and instructions are available at Grants.gov. To access these materials, go to http://www.grants.gov, select “Apply for Grants”, and then follow the instructions. In the Grants.gov search function, enter the funding opportunity number for this announcement (BAA-AFOSR-2011-01). You can also search for the CFDA Number 12.800, Air Force Defense Research Sciences Program. On the Selected Grant Applications for Download page, click on 'download' under the heading 'Instructions and Applications' to download the application package.

The funding opportunity will be listed multiple times. The funding opportunity number is identical for each listing. Select the Competition ID and Competition Title for the directorate specific to your area of interest to download the instructions and application.

If you are unsure which directorate and program manager is appropriate for your specific area of interest, select the Competition ID and Competition Title “Other” to download.

Due to high traffic volume, applicants are highly encouraged to submit applications early. Waiting until the due date and time may result in
applications being late. Common closing dates include the first, fifteenth and last day of any month. Potential applicants are reminded to plan accordingly. Also, please check Grants.gov prior to submission for any notices posted on Grants.gov offering alternate submission options as a result of system saturation. Note: All attachments to all forms must be submitted in PDF format (Adobe Portable Document Format). Grants.gov provides links to PDF file converters at this site: http://www.grants.gov/help/download_software.jsp.

(b) For Hard Copy Submission – For hard copy submission, the original proposal and copies must be delivered to the attention of the program manager at the Air Force Office of Scientific Research at the following address:

AFOSR (Attn: Name of Program Manager)
Air Force Office of Scientific Research
875 North Randolph Street, Room 3112
Arlington VA 22203

In case of difficulties in determining the appropriate AFOSR addressee, proposals may be submitted to:

AFOSR/PKC
875 Randolph Street, Room 3112
Arlington VA 22203-1954

(c) SF 424 Research and Related (R&R) - The SF 424 (R&R) form must be used as the cover page for all electronic and hard copy proposals. No other sheets of paper may precede the SF 424 (R&R) for a hard copy proposal. A signed copy of the SF 424 (R&R) should be submitted with all hardcopy proposals. Complete all the required fields in accordance with the “pop-up” instructions on the form and the following instructions for the specified fields. To see the instructions, roll your mouse over the field to be filled out. You will see additional information about that field. For example on the SF424 (R&R) the Phone Number field says 'PHONE NUMBER (Contact Person): Enter the daytime phone number for the person to contact on matters relating to this application. This field is required.' Mandatory fields will have an asterisk marking the field and will appear yellow on most computers. In grants.gov, some fields will self populate based on the BAA selected. Please fill out the SF 424 first, as some fields on the SF 424 are used to auto populate fields in other forms. The completion of most fields is self-explanatory except for the following special instructions:

- **Field 2**: The Applicant Identifier may be left blank.
- **Field 3**: The Date Received by State and the State Application Identified are not applicable to research.

- **Field 7**: Complete as indicated. If Small Business is selected, please note if the organization is Woman-owned and/or Socially and Economically Disadvantaged. If the organization is a Minority Institution, select "Other" and under “Other (Specify)” note that you are a Minority Institution (MI).

- **Field 9**: List Air Force Office of Scientific Research as the reviewing agency. This field is pre-populated in grants.gov.

- **Field 16**: Choose ‘No’. Check ‘Program is Not Covered By Executive Order 12372’.

- **Attachments**: All attachments to all Grants.gov forms must be submitted in PDF format (Adobe Portable Document Format). To convert attachments into PDF format, Grants.gov provides a list of PDF file converters at [http://www.grants.gov/help/download_software.jsp](http://www.grants.gov/help/download_software.jsp)

A signed copy of the SF 424 (R&R) should be submitted with all hardcopy proposals.

(d) Certification: All awards require some form of certifications of compliance with national policy requirements.

For assistance awards, i.e., grants and cooperative agreements, proposers using the SF 424 (R&R) are providing the certification required by 32 CFR Part 28 regarding lobbying. (The full text of this certification may be found at [http://www.wpafb.af.mil/shared/media/document/AFD-070817-127.pdf](http://www.wpafb.af.mil/shared/media/document/AFD-070817-127.pdf)). If you have lobbying activities to disclose, you must complete the optional form SF-LLL, Standard Form – LLL, ‘Disclosure of Lobbying Activities’ in the downloaded forms package.

If it is determined a contract is the appropriate vehicle, AFOSR will request additional documentation from prospective awardees. For contract awards, prospective contractors shall complete electronic annual representations and certifications at [http://www.bpn.gov/orca](http://www.bpn.gov/orca). The representations and certifications shall be submitted to ORCA as necessary, but updated at least annually, to ensure they are current, accurate, and complete. These representations and certifications are effective until one year from date of submission or update to ORCA. In addition to the ORCA representations and certifications, prospective contractors shall complete the AFOSR Contract Certification which can be located at [http://www.wpafb.af.mil/shared/media/document/AFD-070820-024.doc](http://www.wpafb.af.mil/shared/media/document/AFD-070820-024.doc).
(e) **Research and Related (R&R) Other Forms**: The following other forms must be used for all electronic and hard copy proposals: R&R Senior/Key Person Profile form, R&R Project/Performance Site Locations form, R&R Other Project Information form and the R&R Budget form. The R&R Subaward Budget Attachment Form is required when subawardees are involved in the effort. The SF-LLL form is required when applicants have lobbying activities to disclose. PDF copies of all forms may be obtained at the grants.gov website.

(f) **R&R Senior/Key Person Profile Form** – Complete the R&R Senior/Key Person Profile Form for those key persons who will be performing the research. The principal purpose and routine use of the requested information are for evaluation of the qualifications of those persons who will perform the proposed research. For the principal investigator and each of the senior staff, provide a short biographical sketch and a list of significant publications (vitae) and attach it to the R&R Senior/Key Person Profile Form.

(g) **R&R Project/Performance Site Locations Form** – Complete all information as requested.

(h) **R&R Other Project Information Form - Human Subject/Animal Use and Environmental Compliance.**

**Human Subject Use.** Each proposal must address human subject involvement in the research by addressing Field 1 and 1a of the R&R Other Project Information Form. If Field 1 indicates “Yes”, the Air Force must receive a completed OMB No. 0990-0263 form before a contract, grant, or cooperative agreement may be awarded to support research involving the use of human subjects. Attach the document to the R&R Other Project Information Form. If using grants.gov, a completed OMB No. 0990-0263 form shall be attached in field 12 of the R&R Other Project Information Form. Refer any questions regarding human subjects to Stephanie Bruce of the AFOSR Directorate of Mathematics, Information and Life Sciences at stephanie.bruce@afosr.af.mil.

**Animal Use.** Each proposal must address animal use protocols by addressing Field 2 and 2a of the R&R Other Project Information Form. If selected for award, additional documentation in accordance with Air Force standards will be required. Additional proposal guidance may be found at the AFOSR web site [http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=9388](http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=9388). Refer any questions regarding animal subjects to Stephanie Bruce of the AFOSR Directorate of Mathematics, Information and Life Sciences at stephanie.bruce@afosr.af.mil.

**Environmental Compliance.** Federal agencies making contract, grant, or cooperative agreement awards and recipients of such awards must comply with various environmental requirements. The National Environmental Policy Act of 1969 (NEPA), 42 U.S.C. Sections 4321-4370 (a), requires that agencies consider the environmental impact of “major Federal actions” prior to any final
agency decision. With respect to those awards which constitute “major Federal actions,” as defined in 40 CFR 1508.18, federal agencies may be required to comply with NEPA and prepare an environmental impact statement (EIS) even if the agency does no more than provide grant funds to the recipient. Questions regarding NEPA compliance should be referred to the applicable AFOSR Program Manager. Most research efforts funded by AFOSR will, however, qualify for a categorical exclusion from the need to prepare an EIS. Air Force instructions/regulations provide for a categorical exclusion for basic and applied scientific research usually confined to the laboratory, if the research complies with all other applicable safety, environmental and natural resource conservation laws. Each proposal shall address environmental impact by filling in fields 4a through 4d of the R&R Other Project Information Form. This information will be used by AFOSR to make a determination if the proposed research effort qualifies for categorical exclusion.

Abstract - Include a concise (not to exceed 300 words) abstract that describes the research objective, technical approaches, anticipated outcome and impact of the specific research. In the header of the abstract include the program manager’s name and directorate who should receive the proposal for consideration and evaluation. Attach the Abstract to the R&R Other Project Information form in field 7.

(i) R&R Other Project Information Form - Project Narrative Instructions

Project Narrative – Describe clearly the research including the objective and approach to be performed keeping in mind the evaluation criteria listed in Section V of this announcement. Also briefly indicate whether the intended research will result in environmental impacts outside the laboratory, and how the proposer will ensure compliance with environmental statutes and regulations. Attach the proposal narrative to R&R Other Project Information form in field 8.

Project Narrative - Statement of Objectives – Describe the actual research to be completed, including goals and objectives, on one-page titled Statement of Objectives. This statement of objectives may be incorporated into the award instead of incorporating the entire technical proposal. Active verbs should be used in this statement (for example, “conduct” research into a topic, “investigate” a problem, “determine” to test a hypothesis). It should not contain proprietary information.

Project Narrative - Research Effort – Describe in detail the research to be performed. State the objectives and approach and their relationship and comparable objectives in progress elsewhere. Additionally, state knowledge in the field and include a bibliography and a list of literature citations. Discuss the nature of the expected results. The adequacy of this information will influence the overall evaluation. Proposals for renewal of existing support must include a description of progress if the proposed objectives are related.
Project Narrative – Principal Investigator (PI) Time. PI time is required. List the estimate of time the principal investigator and other senior professional personnel will devote to the research. This shall include information pertaining to other commitments of time, such as sabbatical or extended leave; and proportion of time to be devoted to this research and to other research. Awards may be terminated when the principal investigator severs connections with the organization or is unable to continue active participation in the research. State the number of graduate students for whom each senior staff member is responsible. If the principal investigator or other key personnel are currently engaged in research under other auspices, or expect to receive support from other agencies for research during the time proposed for AFOSR support, state the title of the other research, the proportion of time to be devoted to it, the amount of support, name of agency, dates, etc. Send any changes in this information as soon as they are known. Submit a short abstract (including title, objectives, and approach) of that research and a copy of the budget for both present and pending research projects.

Project Narrative – Facilities. Describe facilities available for performing the proposed research and any additional facilities or equipment the organization proposes to acquire at its own expense. Indicate government-owned facilities or equipment already possessed that will be used. Reference the facilities contract number or, in the absence of a facilities contract, the specific facilities or equipment and the number of the award under which they are accountable.

Project Narrative – Special Test Equipment. List special test equipment or other property required to perform the proposed research. Segregate items to be acquired with award funds from those to be furnished by the Government. When possible and practicable, give a description or title and estimated cost of each item. When information on individual items is unknown or not available, group the items by class and estimate the values. In addition, state why it is necessary to acquire the property with award funds.

Project Narrative – Equipment. Justify the need for each equipment item. Additional facilities and equipment will not be provided unless the research cannot be completed by any other practical means. Include the proposed life expectancy of the equipment and whether it will be integrated with a larger assemblage or apparatus. If so, state who owns the existing apparatus.

Project Narrative – High Performance Computing Availability. Researchers that are supported under an AFOSR grant or contract, and meet certain restrictions, are eligible to apply for special accounts and participation in a full-spectrum of activities within the DOD high performance computing modernization program. This program provides, at no cost to the user, access to a range of state-of-the-art high performance computing assets and training opportunities that will allow the user to fully exploit these assets. Details of the capabilities of the program can be found at the following Internet address: http://www.hpcmo.hpc.mil. Researchers needing high performance cycles
should address the utilization of this program to meet their required needs. AFOSR program managers will facilitate the establishment of accounts awarded.

(j) R&R Budget Form - Estimate the total research project cost. Categorize funds by year and provide separate annual budgets for projects lasting more than one year. In addition to the Research & Related Budget forms available on Grants.gov, the budget proposal should include a budget justification for each year, clearly explaining the need for each item. Applicants who enter a fee on Part J of the budget will not be eligible to receive a grant or cooperative agreement. Should a grant be awarded AFOSR will make payments to educational and non-profit recipients based upon a predetermined payment schedule. Payments will normally be made quarterly in advance of performance, based upon a spending profile which must be provided as part of the proposal. Payments should be limited to the amounts needed to conduct research during each respective period. Educational and Non-profit organizations shall submit a spending profile with their cost proposal. Attach the budget justification and/or spending profile to Section K of the R&R Budget form.

4. Other Submission Requirements

Proposals submitted in whole or in part by electronic media (computer disk or tape, facsimile machine, electronic mail, etc.) will not be accepted (unless the full proposal is submitted electronically through Grants.gov).

5. Application Receipt Notices.

a. For Electronic Submission - The applicant’s approved account holder for grants.gov will receive a confirmation page upon completing the submission to Grants.gov. This confirmation page is a record of the time and date stamp that is used to determine whether the proposal was submitted by the deadline. After an institution submits an application, Grants.gov generates a submission receipt via email and also sets the application status to “Received”. This receipt verifies the Application has been successfully delivered to the Grants.gov system. Next, Grants.gov verifies the submission is valid by ensuring it does not contain viruses, the opportunity is still open, and the applicant login and applicant DUNS number match. If the submission is valid, Grants.gov generates a submission validation receipt via email and sets the application status to “Validated”. If the application is not validated, the application status is set to "Rejected". The system sends a rejection email notification to the institution and the institution must resubmit the application package. Applicants can track the status of their application by logging in to Grants.gov.
b. For Hard Copy Submission – An applicant that submits a hard copy proposal to AFOSR will receive an email from the agency approximately ten days after the proposal due date to acknowledge receipt of the proposal and provide the agency's assigned tracking number. The email is sent to the authorized representative for the applicant institution.

6. Submission Due Dates and Times. This is an open-ended BAA, thus, this announcement will remain open until replaced by a successor BAA. Proposals may be submitted at any time during that period. For topic specific restrictions, see topic descriptions above. For additional information regarding the BAA process please refer to the AFRL BAA Guide for Industry at http://www.wpafb.af.mil/library/factsheets/factsheet.asp?id=6790.

7. Indirect Cost Limitation for Basic Research Awards Notices:
The purpose of this notice is to make offerors aware of the Indirect Cost Limitation for Basic Research Awards as originally set forth in Section 8115 of the Department of Defense Appropriations Act, 2008 (P.L. 110-116) and subsequently included in following year Appropriation Acts. Section 8115 of the DoD Appropriations Act of 2008 (and subsequent Acts) limits payments of negotiated indirect cost rates on contracts, grants, and cooperative agreements (or similar arrangements), which are funded with DoD Basic Research appropriations and are awarded on or after November 14, 2007, to not more than 35 percent of the total cost of the instrument. This limitation also applies to any new award made by another Federal agency to a non-Federal entity on behalf of the DoD using Basic Research appropriations.

• The restriction on payment of indirect costs applies to all DoD Basic Research appropriations obligated by any award – i.e., procurement contract, grant, cooperative agreement, or any other obligational arrangement – to a non-Federal entity or awardee on or after 14 November 2007.

• The limitation on payment of indirect costs applies to an award entered into at the prime level only and does not flow down to subordinate instruments/contracts.

• For the restriction on payment of indirect cost as a percentage of total cost, “total cost” has the meaning given in the Government-wide cost principles that apply to the particular awardee (2 CFR part 220, 225, or 230, or 48 CFR part 31). “Indirect costs” are all costs of a prime award that are Facilities and Administration costs (for awardees subject to the cost principles in 2 CFR part 220) or indirect costs (for awardees subject to the cost principles in 2 CFR part 225 or 230 or 48 CFR part 31.)
V. Application Review Information

AFOSR’s overriding purpose in supporting this research is to advance the state of the art in areas related to the technical problems the Air Force encounters in developing and maintaining a superior Air Force; lowering the cost and improving the performance, maintainability, and supportability of Air Force weapon systems; and creating and preventing technological surprise.

Proposals submitted under this BAA are evaluated through a peer or scientific review process. If selected for contract award, evaluation will be on a competitive basis according to Public Law 98-369, Competition in Contracting Act of 1984, 10 USC 2361, and 10 USC 2374. If selected for grant/assistance instrument award, evaluation will use merit-based competitive procedures according to DoDGARS citation of 32 C.F.R Sec 22.315. Proposals may be evaluated by program managers at EOARD/AOARD and the appropriate AFRL Technology Directorates, other military services, DoD agencies, civilian agencies and non-Government sources. Non-Government sources can include academia, nonprofit institutions, and support contractor personnel. Non-Government evaluators are authorized access only to those portions of the proposal data and discussions that are necessary to enable them to perform their respective duties. Non-Government evaluators are also required to sign nondisclosure agreements which prohibit them from disclosing proprietary information submitted by contractors. However as previously stated in Section IV para 2, AFOSR is seeking white papers and proposals that do not contain proprietary information. If proprietary information is submitted it is the offerors responsibility to mark the relevant portions of their proposal as specified in Section IV para 2.

Employees of commercial firms under contract to the Government may be used to administratively process proposals and may gain access to proprietary information contained in proposals and/or post award documentation. These support contracts include nondisclosure agreements prohibiting their contractor employees from disclosing any information submitted by other contractors.

Proposals submitted for Special Programs listed in Section I shall be evaluated under criteria as specified in their description. Subject to funding availability, all other proposals will be evaluated under the following two primary criteria, of equal importance, as follows:

1. Technical merits of the proposed research and development; and
2. Potential relationship of the proposed research and development to Department of Defense missions.

Other evaluation criteria used in the technical reviews, which are of lesser importance than the primary criteria and of equal importance to each other, are:
1. The likelihood of the proposed effort to develop new research capabilities and broaden the research base in support of U.S. national defense.

2. The proposer's capabilities integral to achieving USAF objectives. This includes principal investigator's, team leader's, or key personnel's qualifications, related experience, facilities, or techniques or a combination of these factors integral to achieving USAF objectives.

3. Overall realism and reasonableness of proposed costs.

Additional administrative information regarding submission of applications is contained in Section VIII below. The technical and cost information will be analyzed simultaneously during the evaluation process.

For conference support, please see the evaluation criteria listed under the heading of “Conferences and Workshops” under Section I of this announcement.

Proposals may be submitted for one or more topics or for a specific portion of one topic. A proposer may submit separate proposals on different topics or different proposals on the same topic. The U.S. Government does not guarantee an award in each topic area. Further, be advised that as funds are limited, otherwise meritorious proposals may not be funded. Therefore, it is important that proposals show strength in as many of the evaluation area as practicable for maximum competitiveness.

VI. Award Administration Information

1. Award Notices.

Should your proposal be selected for award, the principal investigator will receive a letter from the Technical Directorate stating this information. This is not an authorization to begin work. Your business office will be contacted by the grant or contracting officer to negotiate the terms of your award.

2. Reporting Requirements.

Grants and cooperative agreements typically require annual and final technical reports, financial reports, and final patent reports. Contracts typically require annual and final technical and patent reports. Copies of publications and presentations should be submitted.

Additional deliverables may be required based on the research being conducted.

3. Additional information for offerors seeking contract awards.

a.
5352.245-9005 Elimination of Competitive Advantage in the Use of Government Property.

ELIMINATION OF COMPETITIVE ADVANTAGE IN THE USE OF GOVERNMENT PROPERTY (AFMC) (OCT 2008)

(a) Unless otherwise specified in this solicitation or attachments, the Government does not plan to furnish any facilities, special tooling, special test equipment or other Government property for use in the performance of the contract resulting from this solicitation.

(b) The Government may, however, authorize such use in accordance with FAR 45.3, Providing Government Property to Contractors. To use existing Government property in the performance of this proposed contract, a copy of the cognizant Contracting Officer's written concurrence with such use must be furnished to the Government as a part of the response to this solicitation. Your proposal must include a listing of Government property you desire to use in the performance of the proposed contract, including the following information for each item: nomenclature, date of purchase, acquisition value, number of months of contemplated use (identify first, last, and all intervening months), rental fee, if applicable, and the copy of the Contracting Officer's written concurrence for such use.

(c) In the event that permission for such use of Government property is not authorized and the Contractor must furnish the property to perform the contract, identify the total cost impact, if any, to the proposed price.

(d) An evaluation factor as set forth in FAR 45.202, Evaluation Procedures, will be used to eliminate any competitive advantage from the use of such property unless the Contracting Officer determines that the use of an evaluation factor would not affect the choice of Contractor.

(End of provision)

b.

1. AFOSR is in the process of pursuing recognition under the Occupational Safety and Health Administration’s (OSHA) Voluntary Protection program (VPP). Include the OSHA website in the solicitation and request offerors use it to familiarize themselves with the VPP program.

2. Contractors are required to provide 3 years of TCIR/DART data with their proposal for Government evaluation.

3. Contractors will be required to provide their Safety Plans within 10 days of award.

c.

252.227-7017 Identification and Assertion of Use, Release, or Disclosure Restrictions.

As prescribed in 227.7103-3(b), 227.7104(e)(2), or 227.7203-3(a), use the following provision:

IDENTIFICATION AND ASSERTION OF USE, RELEASE, OR DISCLOSURE RESTRICTIONS (JUN 1995)
(a) The terms used in this provision are defined in following clause or clauses contained in this solicitation—

(1) If a successful offeror will be required to deliver technical data, the Rights in Technical Data--Noncommercial Items clause, or, if this solicitation contemplates a contract under the Small Business Innovative Research Program, the Rights in Noncommercial Technical Data and Computer Software--Small Business Innovative Research (SBIR) Program clause.

(2) If a successful offeror will not be required to deliver technical data, the Rights in Noncommercial Computer Software and Noncommercial Computer Software Documentation clause, or, if this solicitation contemplates a contract under the Small Business Innovative Research Program, the Rights in Noncommercial Technical Data and Computer Software--Small Business Innovative Research (SBIR) Program clause.

(b) The identification and assertion requirements in this provision apply only to technical data, including computer software documentation, or computer software to be delivered with other than unlimited rights. For contracts to be awarded under the Small Business Innovative Research Program, the notification and identification requirements do not apply to technical data or computer software that will be generated under the resulting contract. Notification and identification is not required for restrictions based solely on copyright.

(c) Offers submitted in response to this solicitation shall identify, to the extent known at the time an offer is submitted to the Government, the technical data or computer software that the Offeror, its subcontractors or suppliers, or potential subcontractors or suppliers, assert should be furnished to the Government with restrictions on use, release, or disclosure.

(d) The Offeror's assertions, including the assertions of its subcontractors or suppliers or potential subcontractors or suppliers, shall be submitted as an attachment to its offer in the following format, dated and signed by an official authorized to contractually obligate the Offeror:

Identification and Assertion of Restrictions on the Government's Use, Release, or Disclosure of Technical Data or Computer Software.

The Offeror asserts for itself, or the persons identified below, that the Government's rights to use, release, or disclose the following technical data or computer software should be restricted:

<table>
<thead>
<tr>
<th>Technical Data or Computer Software</th>
<th>to be Furnished</th>
<th>Basis for</th>
<th>Asserted Rights</th>
<th>Asserting</th>
<th>Name of Person</th>
</tr>
</thead>
</table>

95
For technical data (other than computer software documentation) pertaining to items, components, or processes developed at private expense, identify both the deliverable technical data and each such item, component, or process. For computer software or computer software documentation identify the software or documentation.

Generally, development at private expense, either exclusively or partially, is the only basis for asserting restrictions. For technical data, other than computer software documentation, development refers to development of the item, component, or process to which the data pertain. The Government's rights in computer software documentation generally may not be restricted. For computer software, development refers to the software. Indicate whether development was accomplished exclusively or partially at private expense. If development was not accomplished at private expense, or for computer software documentation, enter the specific basis for asserting restrictions.

Enter asserted rights category (e.g., government purpose license rights from a prior contract, rights in SBIR data generated under another contract, limited, restricted, or government purpose rights under this or a prior contract, or specially negotiated licenses).

Corporation, individual, or other person, as appropriate.

Enter “none” when all data or software will be submitted without restrictions.

Date
Printed Name and Title
Signature

(e) An Offeror's failure to submit, complete, or sign the notification and identification required by paragraph (d) of this provision with its offer may render the offer ineligible for award.

(f) If the Offeror is awarded a contract, the assertions identified in paragraph (d) of this provision shall be listed in an attachment to that contract. Upon request by the Contracting Officer, the Offeror shall provide sufficient information to enable the Contracting Officer to evaluate any listed assertion.

(End of provision)
**VII. Agency Contacts**

Should you have questions about a technical research area, contact the program manager listed for the research topic areas listed in Section I. Should you have questions about the BAA or procedures for submission of a proposal, please email afosr.baa@afosr.af.mil.

**Important Notice Regarding Questions of a Business Nature**
All questions shall be submitted in writing by electronic mail. Questions presented by telephone call, fax message, or other means will not be responded to.

**VIII. Additional Information**

1. The cost of proposal preparation in response to this Announcement is not considered an allowable direct charge to any resulting award. Such cost is, however, an allowable expense to the normal bid and proposal indirect cost specified in FAR 31.205-18, or OMB Circular A-21, Cost Principles for Educational Institutions or OMB Circular A-122, Cost Principles for Nonprofit Organizations.

2. Every effort will be made to protect the confidentiality of the proposal and any evaluations. The proposer must mark the proposal with a protective legend in accordance with FAR 52.215-1(e), Instructions to Offerors – Competitive Acquisition (Jan 2004), if protection is desired for proprietary or confidential information.

3. Offerors are advised that employees of commercial firms under contract to the Government may be used to administratively process proposals. These support contracts include nondisclosure agreements prohibiting their contractor employees from disclosing any information submitted by other contractors.

4. Only contracting or grants officers are legally authorized to bind the government.

5. AFOSR documents are available on the AFOSR website at http://www.wpafb.af.mil/AFRL/afosr/.

7. Prospective awardee shall be registered in the CCR database prior to award, during performance, and through final payment of any award resulting from this announcement. Offerors may obtain information on registration and annual confirmation requirements via the Internet at http://www.ccr.gov or by calling 1-888-227-2423, or 269-961-5757.
8. AFOSR expects the performance of research funded by this announcement to be fundamental. DoD Directive 5230.24 and DoD Instruction 5230.27 define contracted fundamental research in a DoD context as follows:

“Contracted Fundamental Research. Includes [research performed under] grants and contracts that are (a) funded by budget Category 6.1 ("Research"), whether performed by universities or industry or (b) funded by budget Category 6.2 ("Exploratory Development") and performed on-campus at a university. The research shall not be considered fundamental in those rare and exceptional circumstances where the 6.2-funded effort presents a high likelihood of disclosing performance characteristics of military systems or manufacturing technologies that are unique and critical to defense, and where agreement on restrictions have been recorded in the contract or grant.”

9. Federal Awardee Performance and Integrity Information System (FAPIIS)

Potential offerors should be aware that as of April 2010 (SAF/AQC Memo, “Contractor Responsibility (EPLS and FAPIIS Requirements) awardees of contracts or recipients of grants have been required to update the information in the Federal Awardee Performance and Integrity Information System (FAPIIS) on a semi-annual basis, throughout the life of the agreement, by entering the required information in the Central Contractor Registration database at http://www.ccr.gov (see 52.204-7). Contract clauses and Grant articles provide specific information on this requirement.

10. Additional Subcontract/Subaward Reporting Requirements

The Federal Funding and Transparency Act and 22 September 2010 DDR&E memo, “New Reporting required Under DoD Grant and Cooperative Agreements” require that as of 01 October 2010 awardees of contracts and recipients of grants have been required to report Executive Compensation and First-Tier Subcontract/Subrecipient Awards for any contract or grant valued at $25,000 or more excluding classified contracts or contracts/grants with individuals. Two articles have been added to all awards as a consequence of this requirement. See below:

CCR Registration: Unless exempted by 2 CFR 25.110 all offerors must:

(1) Be registered in the Central Contractor Registration (CCR) prior to submitting an application or proposal;

(2) Maintain an active CCR registration with current information at all times during which it has an active Federal award or an application or proposal under consideration by an agency; and

(3) Provide its DUNS number in each application or proposal it submits to the agency.

Reporting Subawards and Executive Compensation.
a. Reporting of first-tier subawards.

1. Applicability. Unless you are exempt (in the previous tax year, you had gross income, from all sources, under $300,000) from the requirements to report each action that obligates $25,000 or more in Federal funds that does not include Recovery funds (as defined in section 1512(a)(2) of the American Recovery and Reinvestment Act of 2009, Pub. L. 111–5) for a subaward to http://www.fsrs.gov.

11. OMBUDSMAN

(a) An ombudsman has been appointed to hear and facilitate the resolution of concerns from offerors, potential offerors, and others for this acquisition. When requested, the ombudsman will maintain strict confidentiality as to the source of the concern. The existence of the ombudsman does not affect the authority of the program manager, contracting officer, or source selection official. Further, the ombudsman does not participate in the evaluation of proposals, the source selection process, or the adjudication of protests or formal contract disputes. The ombudsman may refer the party to another official who can resolve the concern.

(b) Before consulting with an ombudsman, interested parties must first address their concerns, issues, disagreements, and/or recommendations to the contracting officer for resolution. Consulting an ombudsman does not alter or postpone the timelines for any other processes (e.g., agency level bid protests, GAO bid protests, requests for debriefings, employee-employer actions, contests of OMB Circular A-76 competition performance decisions).

(c) If resolution cannot be made by the contracting officer, concerned parties may contact the Center/MAJCOM or AFISRA ombudsmen,

Ombudsman: Ms. Karen Sue Hunter, HQ AFRL/PK, Wright-Patterson AFB OH

Telephone: (937) 904-4407

Email: Karen.Hunter@afrl.af.mil. Concerns, issues, disagreements, and recommendations that cannot be resolved at the MAJCOM/DRU or ARISRA level, may be brought by the concerned party for further consideration to the Air Force ombudsman, Associate Deputy Assistant Secretary (ADAS) (Contracting), SAF/AQC, 1060 Air Force Pentagon, Washington DC 20330-1060, phone number (703) 588-7004, facsimile number (703) 588-1067.

(d) The ombudsman has no authority to render a decision that binds the agency.

(e) Do not contact the ombudsman to request copies of the solicitation, verify offer due date, or clarify technical requirements. Such inquiries shall be directed to the Contracting Officer.
